Statistician, Energy Statistics Section

Beirut, Lebanon, 2 July 2019

UNSD/ESCWA Technical Assistance to Lebanon

Overview

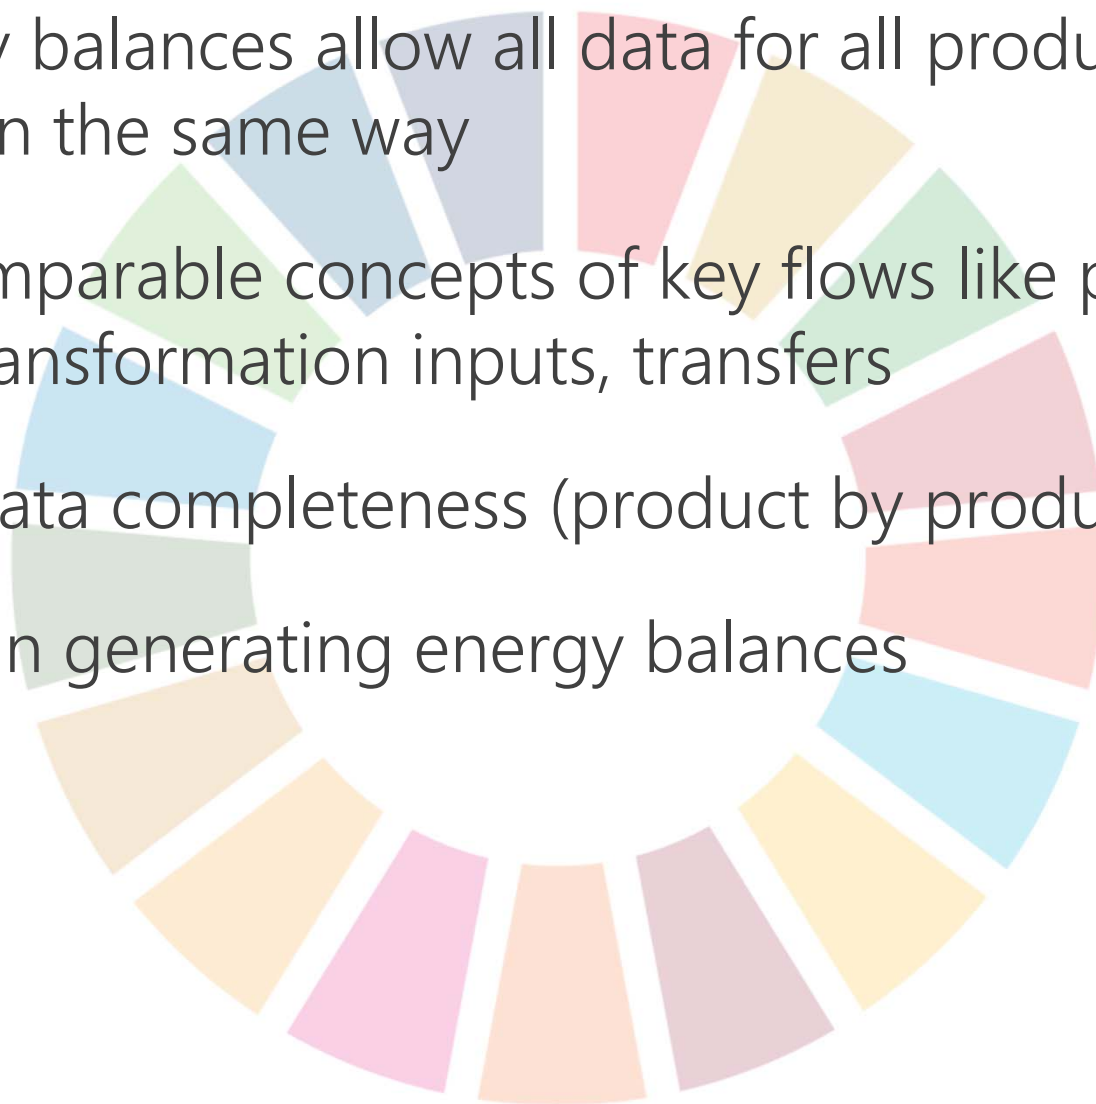

- Commodity balances
 - Structure and principles
 - Calculation of an energy balance
 - Reading an energy balance
 - Checking an energy balance
 - Importance of conversion factors
 - Conclusion
- 

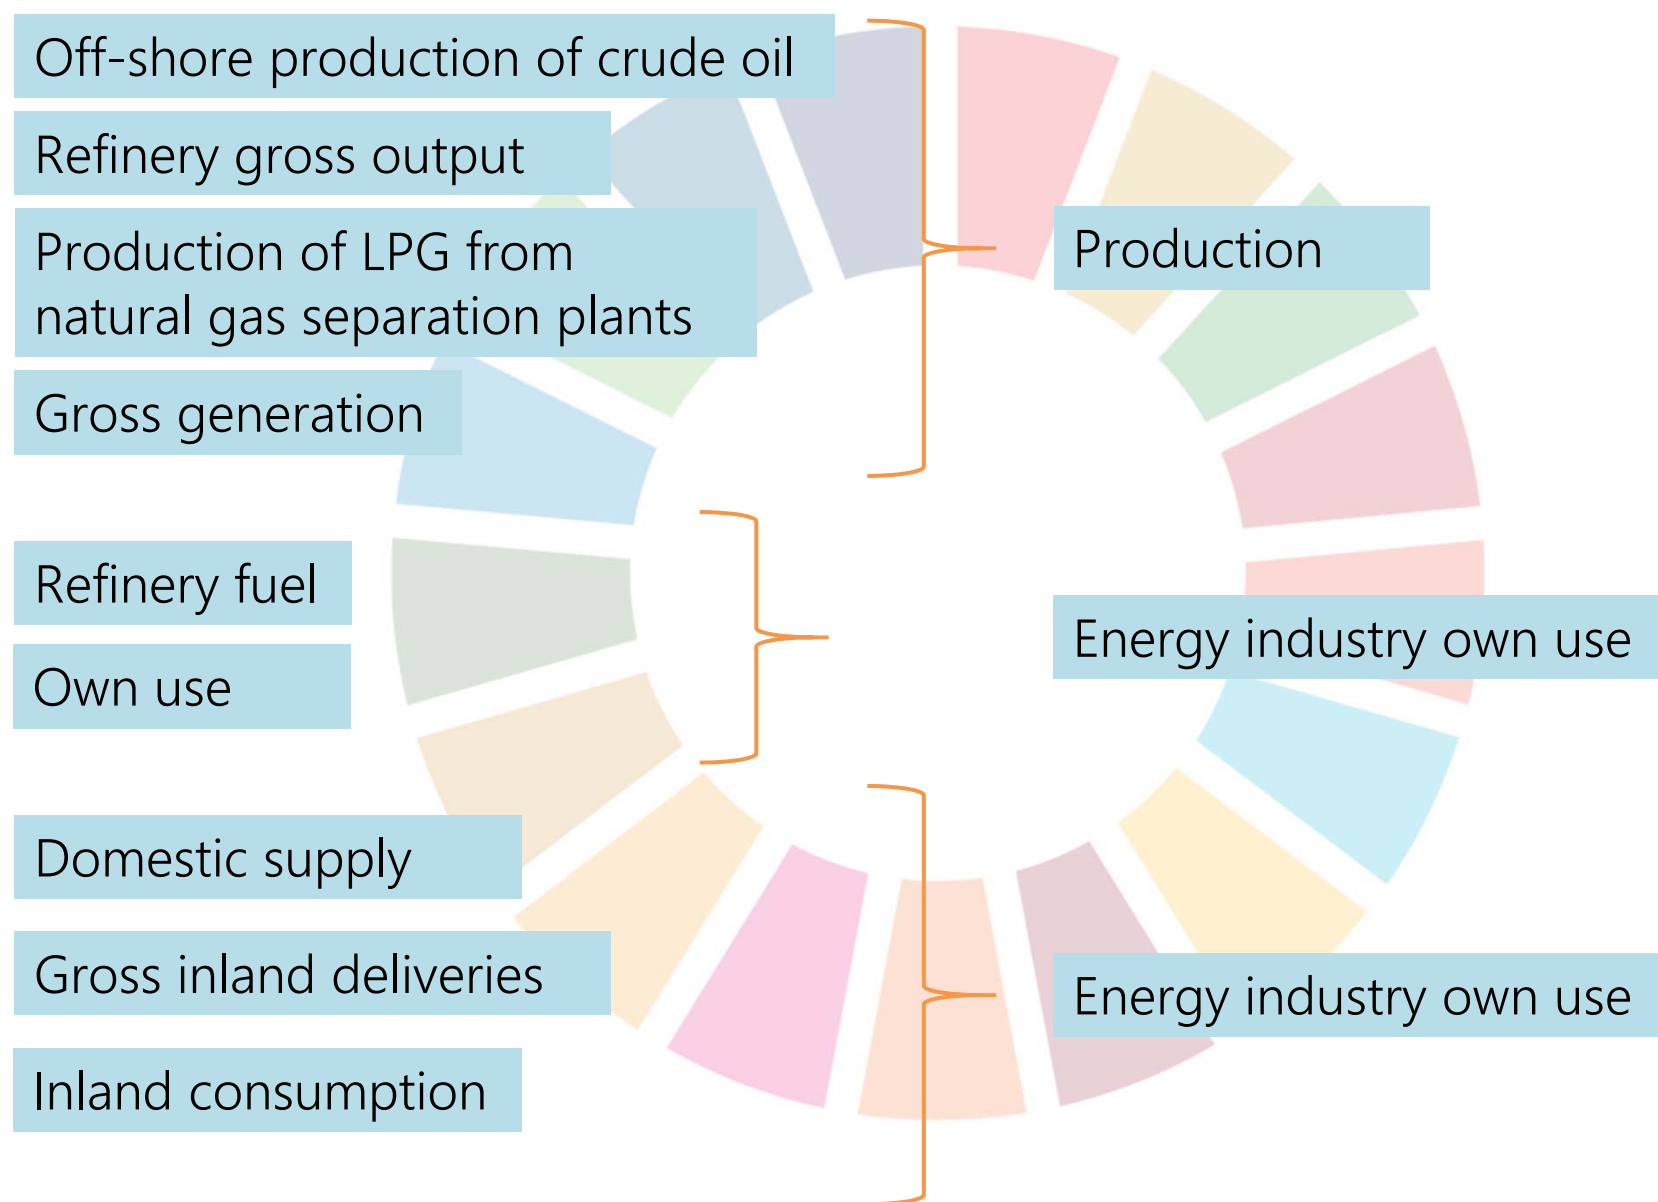

Commodity balances

Why to create commodity balances

- Commodity balances allow all data for all products to be presented in the same way
- Directly comparable concepts of key flows like production, own use, transformation inputs, transfers
- Check on data completeness (product by product)
- A key step in generating energy balances

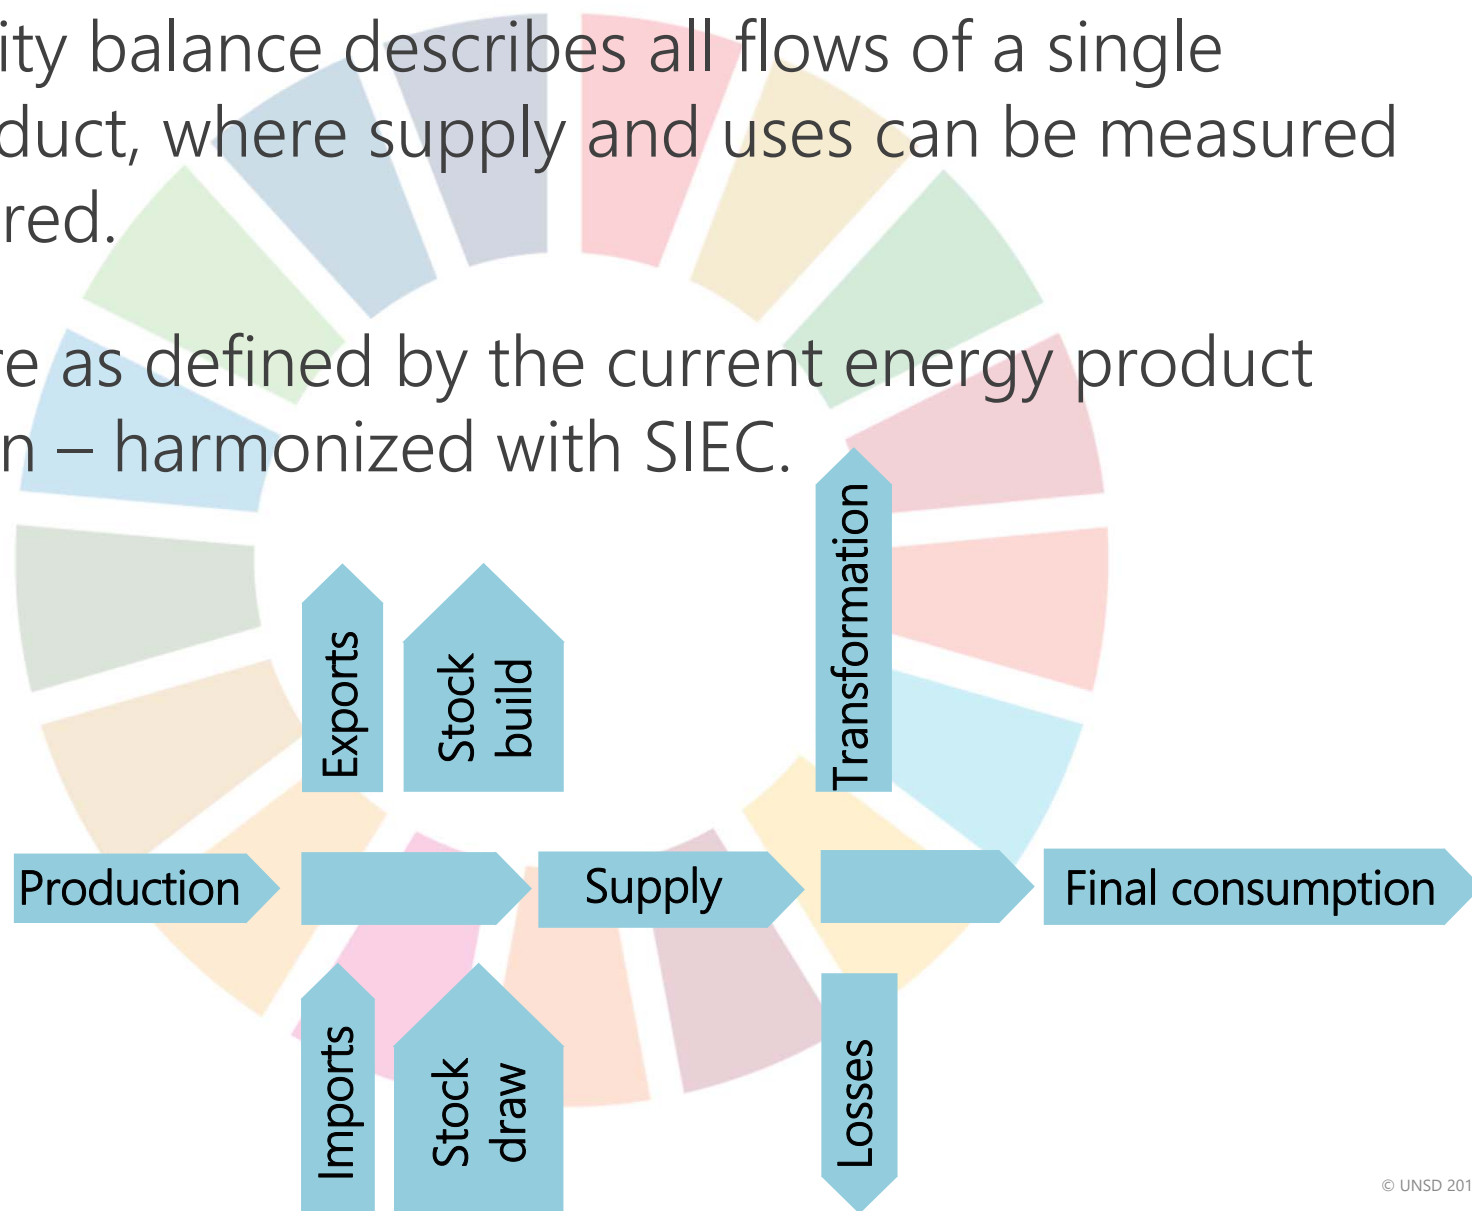

Energy data – commodity balances

Commodity balances

- A commodity balance describes all flows of a single energy product, where supply and uses can be measured and compared.
- Products are as defined by the current energy product classification – harmonized with SIEC.

What products are collected annually?

- Coal (11 categories)
- Crude Oil and Petroleum products (25 categories)
- Natural gas
- Manufactured Gases (4 categories)
- Electricity
- Heat
- Direct use of geothermal and solar thermal heat
- Renewables and waste (13 categories)

What flows are collected annually?

Production

- from plants/from refinery
- electricity and heat by source and type of plants

Receipt from other sources

Import and Export

Marine Bunkers

Stock Changes

= Total Energy Supply

Transfers and recycled products

Statistical Differences

Transformation Sector (21 sub-sectors)

Energy industries own use (17 sub-sectors)

Distribution Losses

Final Consumption =

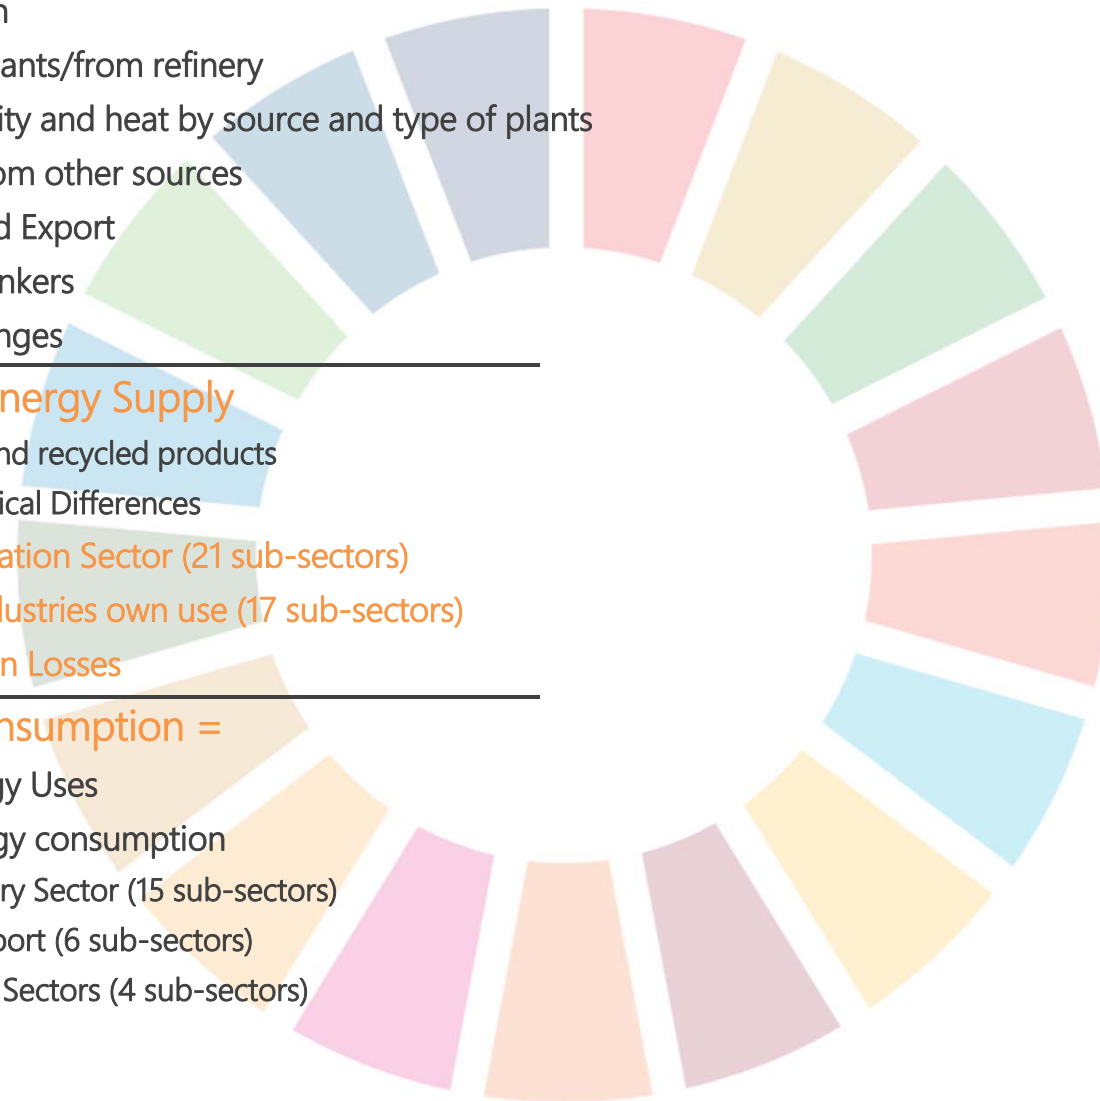

Non Energy Uses

Final energy consumption

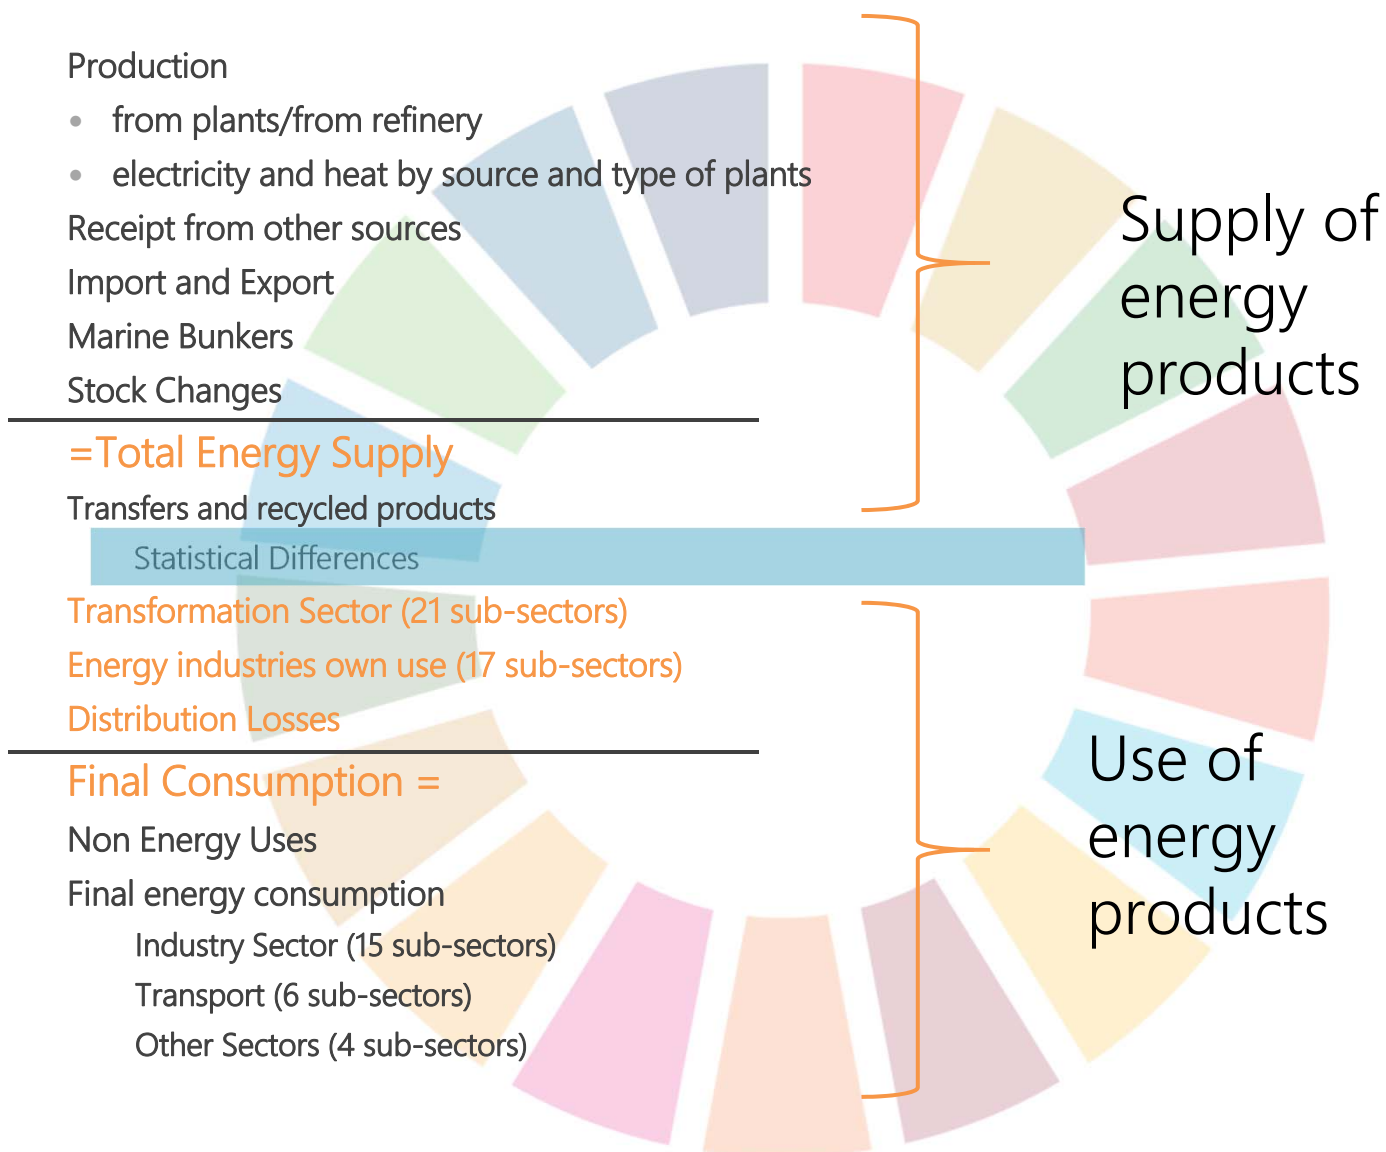

Industry Sector (15 sub-sectors)

Transport (6 sub-sectors)

Other Sectors (4 sub-sectors)

Supply and use of energy products

Commodity balances

Commodity balances - basic energy statistics

- combinations of products and flows
- flows grouped under the commodity header

Limitations of commodity balances

- different units/calorific values - commodities incomparable
- production double counted

Motor Gasoline; Metric tons, thousand	2014	2015
Production	3627	3939
Receipts from other sources	206	238
Imports	371	363
Exports	672	762
Stock changes	-56	-22
Total energy supply	3588	3800
Final consumption	3577	3800
Final energy consumption	3577	3800
Transport	3572	3796
Road	3572	3796

Natural Gas ; Terajoules	2014	2015
Production	173349	171329
Imports	451673	464842
Exports	2880	2112
Total energy supply	623574	640849
Transformation	83409	96802
Energy industries own use	53212	55607
Losses	1259	1237
Final consumption	484232	493534
Non-energy uses	95888	98600
Final energy consumption	388344	394934

Fuelwood ; Cubic metres, thousand	2014	2015
Production	22044	22388
Total energy supply	22044	22388
Transformation	4657.8	4776.5
Transformation in electricity and heat	4657.8	4776.5
Final consumption	17386	17611
Non-energy uses		
Final energy consumption	17386	17611
Households	11544	11544

Structure and principles

Framework

An Energy Balance is an accounting framework that presents :

- country's energy **supply and demand**;
- all energy products **entering, exiting and used** within a **national territory**;
- energy **transformation processes** (inputs and outputs)
in **one energy unit**
using **net calorific values** to measure the energy content of energy products.

Energy balance format

Main blocks

Formats

- An energy balance can be highly detailed or presented in a more aggregated format.
- IRES recommends that countries collect and compile energy balances at a relatively high level of detail.

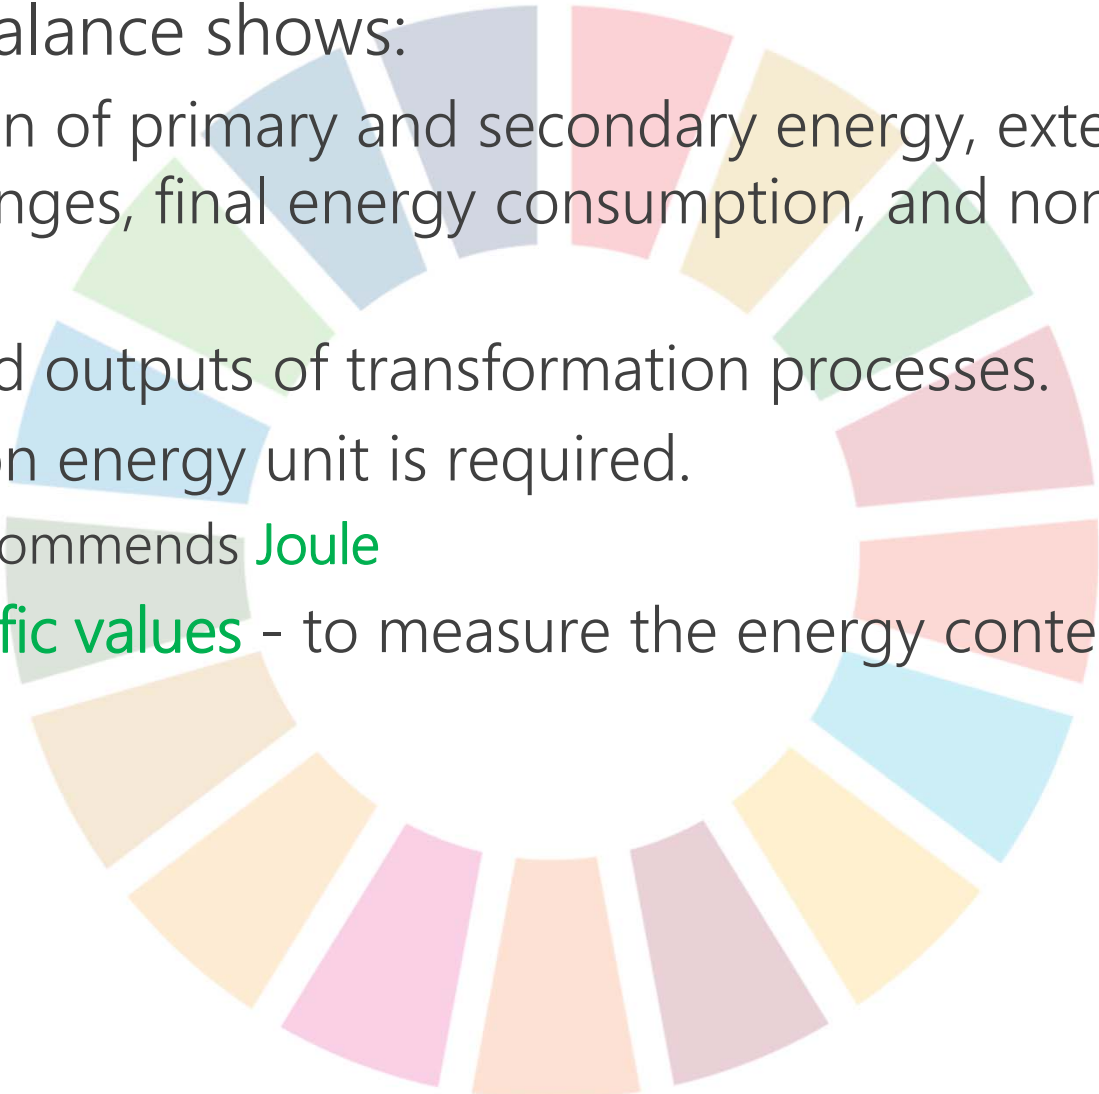

Table 8.2
Template of an aggregated energy balance

Item code	Flows	Energy products					
		E1	E2	E3	...	Total	of which: Renewables
1.1	Primary production						
1.2	Imports						
1.3	Exports						
1.4	International bunkers						
1.5	Stock change (closing-opening)						
1	Total energy supply						
2	Statistical difference						
3	Transfers						
4	Transformation processes						
5	Energy industries own use						
6	Losses						
7	Final consumption						
7.1	Final energy consumption						
7.1.1	Manufacturing, const. and non-fuel mining industries, total						
7.1.1.1	Iron and steel						
7.1.1.2	Chemical and petrochemical						
7.1.1.X	Other industries						
7.1.2	Transport, total						
7.1.2.1	Road						
7.1.2.2	Rail						
7.1.2.3	Domestic aviation						
7.1.2.4	Domestic navigation						
7.1.2.X	Other Transport						
7.1.3	Other, total						
7.1.3.1	<i>of which: Agriculture, forestry and fishing</i>						
7.1.3.2	<i>of which: Households</i>						
7.2	Non-energy use						

Principles

An energy balance shows:

- Production of primary and secondary energy, external trade, stock changes, final energy consumption, and non-energy use.
- Inputs and outputs of transformation processes.
- A common energy unit is required.
 - IRES recommends **Joule**
- **Net calorific values** - to measure the energy content of energy products.

Stock changes
Total energy supply	7112	332623	5384	1624	1017	347760

- Electricity primary production is small, as it accounts only electricity from hydro, solar etc.
- Electricity from gas diesel or fuel oil is counted under transformation.

Middle block

Lebanon, 2016						
	Coal	Oil	Biofuels and waste	Electricity	Heat	Total energy
Transfers
Transformation	..	-188976	-585	65909	..	-123652

Other transformation	-585	-585
Energy industries own use	0	..	0
Losses	-7042	..	-7042

- **Transfers** – comprise products transferred and interproduct transfers, present changes in use or identity of a product.
- **Transformation** – processes that convert an energy product into another energy product which, in general, is more suitable for specific uses
- **Energy industries own use** – consumption of fuels and energy for the direct support of the production, and preparation for use of fuels and energy
- **Losses** – losses during the transmission, distribution and transport of fuels, heat and electricity

Transformation – electricity plants

Households	..	*41005	4091	23854	660	*69610
Other consumers	708	*10775	..	*11483
Non-energy use	..	3692	3692

- Breakdown on final energy consumption and non-energy consumption
- Transport consumption of all "on road" vehicles, not depending if it is private passenger car, bus or cargo.

Checking an energy balance

Checking an energy balances

- Transformation losses:
 - may highlight **problems** in either the basic energy **data** in commodity balances or in the **conversion equivalents**
- Statistical differences:
 - if much higher than in the commodity balance, could indicate problems with **calorific values**
 - Example: domestically produced lignite has a different calorific value from imported lignite.
- Generation efficiencies can be used to reconcile inputs and outputs from each transformation activity.

Relevance of an energy balance

- In an ideal world "Supply" = "Demand".
- An energy balance is an accounting framework that seeks to reconcile supply with demand. When aggregate supply is different from aggregate demand, the difference is shown as statistical difference.
- **Energy balances are a powerful tool** for validation and reconciliation.

Importance of conversion factors

Conversion to energy units

Physical units are:

- converted to energy units using Net Calorific Values (NCV),
- NCV ideally are measured frequently for different processes and sources and then averaged for the country/flow.

Ideally:

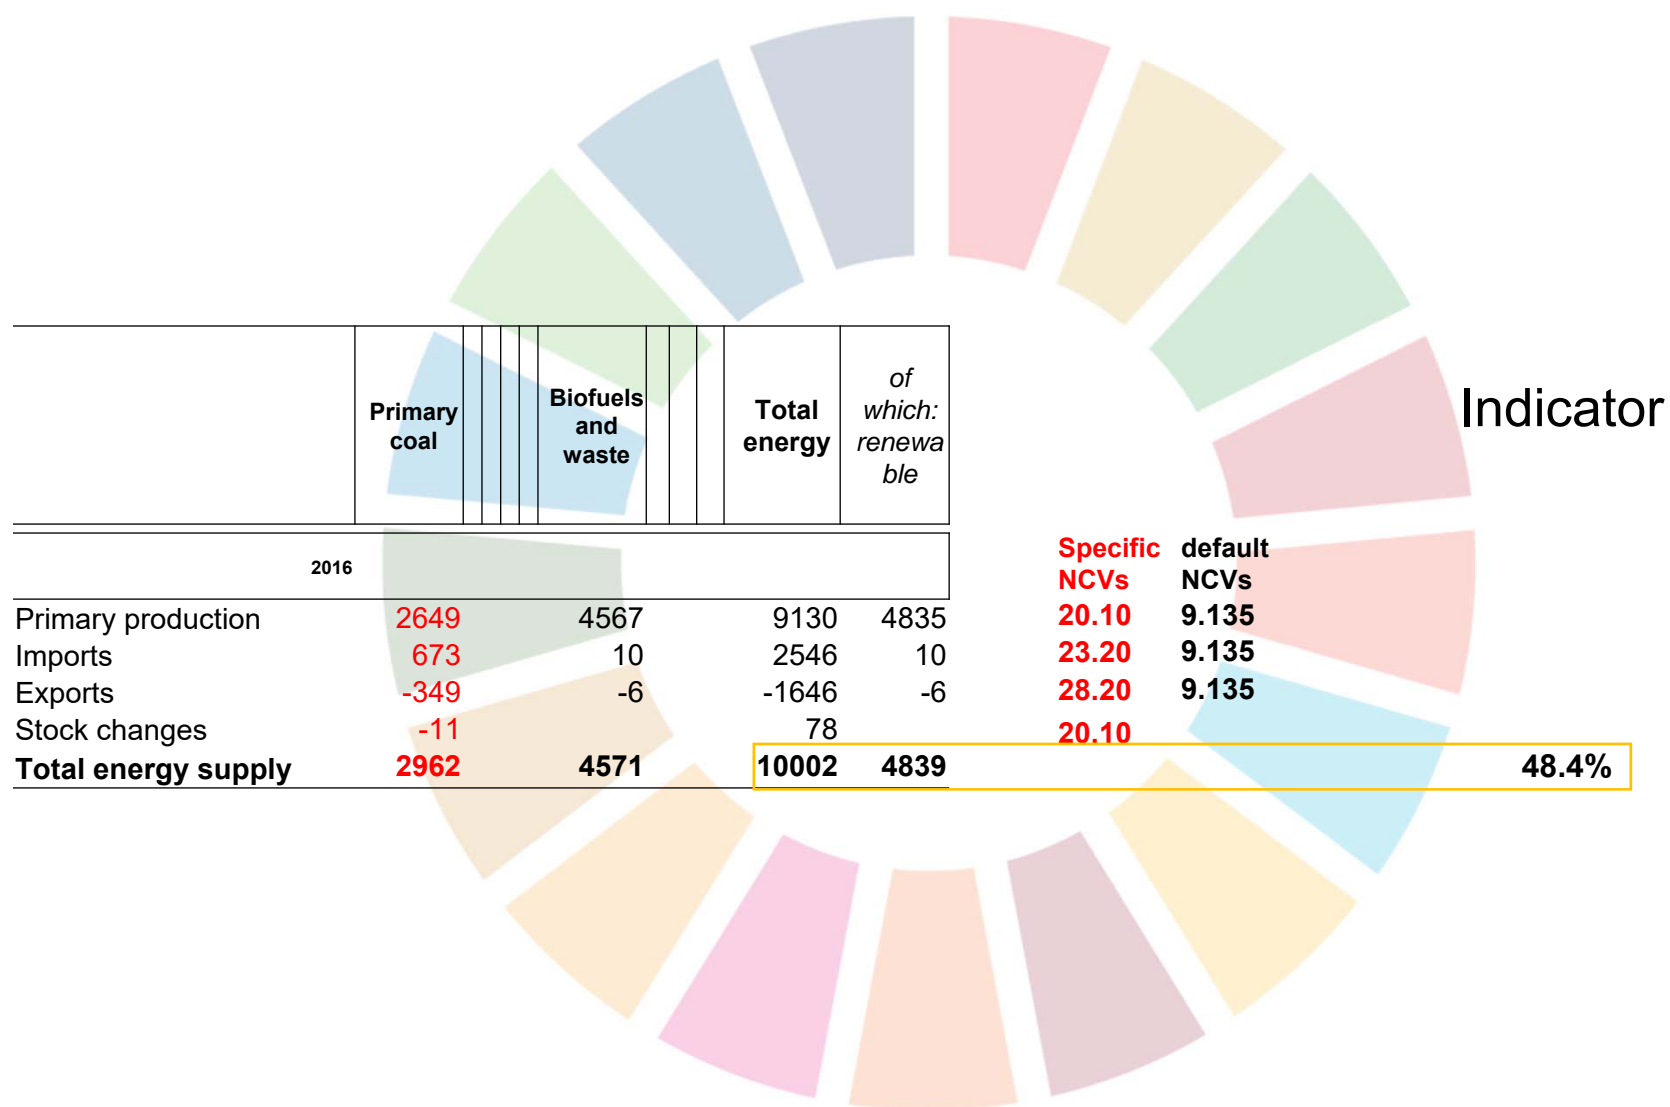

- Specific NCV for different flows, when available (most importantly, Production and Imports)
- Weighted-average NCV for all other flows (if only NCVs for Production and Imports are available).
- Default NCV if no information available (undesirable case)

If commodities are reported in energy units, the appropriate conversion to a common unit must be made.

Renewable energy supply (% of TES) – NCVs

Renewable energy supply (% of TES) – NCVs

Renewable energy supply (% of TES) – NCVs

Renewable energy supply (% of TES) – NCVs

Total primary energy supply

Conclusion

Conclusion

While the **structure** of an energy balance **depends** **on a country's energy production** and consumption patterns and the level of detail that the country requires, it is recommended that common approaches be **followed** to ensure **international comparability and consistency**.

Conclusion

To verify if your energy balance follows international recommendations please refer to IRES “recommendations and encouragements”.

Table 1.1 Summary of the main recommendations and encouragements contained in IRES

Chapter VIII. Energy balances	
8.1	The energy balance should be as complete as possible so that all energy flows are, in principle, accounted for. It should be based firmly on the first law of thermodynamics, which states that the amount of energy within any closed system is fixed and can neither be increased nor diminished unless energy is brought into or sent out from that system.
8.5	It is recommended that countries collect data at a level of detail that allows for the compilation of a detailed energy balance, as presented in table 8.1. When such a level of detail is not available or practical, it is recommended that countries, at a minimum, follow the template of the aggregated energy balance presented in table 8.2.
8.9 (a)	The energy balance is compiled with respect to a clearly defined reference period. In this respect, it is recommended that countries, as a minimum, compile and disseminate an energy balance on an annual basis.
8.9(h)	All entries in the energy balance should be expressed in one energy unit (it is recommended that Joule is used for this purpose, although countries could use other energy units, such as toe, tce, etc.). The conversion between energy units should be through the application of appropriate conversion factors (see chapter IV) and the applied factors should be reported with the energy balance to make any conversion from physical units to Joules or other units transparent and comparable.
8.9(j)	In the case of electricity generation from primary heat (nuclear, geothermal and concentrating solar), it is recommended that an estimate of the heat input be used based on an efficiency of 33 per cent for nuclear and concentrating solar, and 10 per cent for geothermal as a default, unless country- or case-specific information is available.
8.10	While the structuring of an energy balance depends on a country's energy production and consumption patterns and the level of detail that the country requires, it is recommended that common approaches be followed to ensure international comparability and consistency (see section 8.C).
8.12	While different columns (except “total”) represent various energy products, they might be grouped and sequenced in a way that adds to the analytical value of the balance. In this connection, it is recommended that: (a) Groups of energy products be mutually exclusive and based on SIEC; (b) The column “total” follow the columns for individual energy products (or groups of products); (c) The column “total” be followed by supplementary columns containing additional subtotals such as “renewables”. The definition of such subtotals and any additional clarification on the column's coverage should be provided in appropriate explanatory notes.
8.14	It is recommended that an energy balance contain three main blocks of rows as follows: (a) Top block—flows representing energy entering and leaving the national territory, as well as stock changes to provide information on the supply of energy on the national territory during the reference period; (b) Middle block—flows showing how energy is transformed, transferred, used by energy industries for own use and lost in distribution and transmission; (c) Bottom block—flows reflecting final energy consumption and non-energy use of energy products.
