- M-1: one-month old data (Example: On 25 November 2018, submitted data is for October 2018)
 - Some countries are not able to collect all the required data from all data sources
 - Due to such limitations in the data collection system, these countries are allowed to report M-2
- M-2: two-month old data (Example: On 25 November 2018, submitted data is for September 2018)
 - M-2 data more complete and available
 - Submission of M-1 data is encouraged
 - Revision of M-2 and earlier data is encouraged

- Preferred reporting unit: thousand metric tons
- Volumetric units also accepted (barrels, cubic meters)
- National Administrations are asked to provide the specific densities for each product for conversion

- Conversion from volume to mass: specific density is different for each product
- Conversion factor for “Total Oil” should be the weighted average of all included products

Typical densities, conversion factors and calorific values for crude oil and petroleum products

⁽¹⁾ Assumes a mixture of 60% propane and 40% butane by mass.

⁽²⁾ An average for motor gasolines with RON between 91 and 95.

^(*) For Naphtha and heavier oils the net calorific value is assumed to be 95% of gross.

Converting volume into mass

- Converting 100,000 barrels of motor gasoline into metric tons
- Density of motor gasoline for conversion from volume to mass
- Density of motor gasoline: 8.49bbl/t

- Calculation:
$$\frac{100,000 \text{ bbl}}{8.49 \text{ bbl/t}} = \mathbf{11.78kt}$$
