

The image is a promotional graphic for a webinar. It features a background of a desert landscape at sunset with a stylized map of the Arab region overlaid. The text is arranged as follows:

- Top Left:** RICCAR logo with the text "Regional Initiative for the Assessment of Climate Change Impacts on Water Resources & Socio-Economic Vulnerability in the Arab Region".
- Top Center:** "Regional Initiative for the Assessment of Climate Change Impacts on Water Resources & Socio-Economic Vulnerability in the Arab Region" and "WEBINAR SERIES ON CLIMATE CHANGE ANALYSIS USING GIS TOOLS".
- Bottom Left:** "Module 4: Creating a regional climate model ensemble using GIS and extreme events indices".
- Bottom Right:** United Nations ESCWA logo.

## Webinar Series

- **Module 1:** RICCAR regional climate modelling and hydrological modelling datasets: An introduction
- **Module 2:** Viewing NetCDF regional climate modeling datasets in GIS
- **Module 3:** Extracting tabular data from NetCDF climate files for use in other models and applications
- ✓ **Module 4:** [Creating a regional climate model ensemble using GIS and extreme events indices](#)
- **Module 5:** Accessing global and regional climate datasets and platforms
- **Module 6:** RICCAR integrated vulnerability assessment methodology

2

## Module 4: Contents

- Benefits of ensemble analysis
- How to create a regional climate model (RCM) ensemble in GIS
- RICCAR extreme events indices and applications

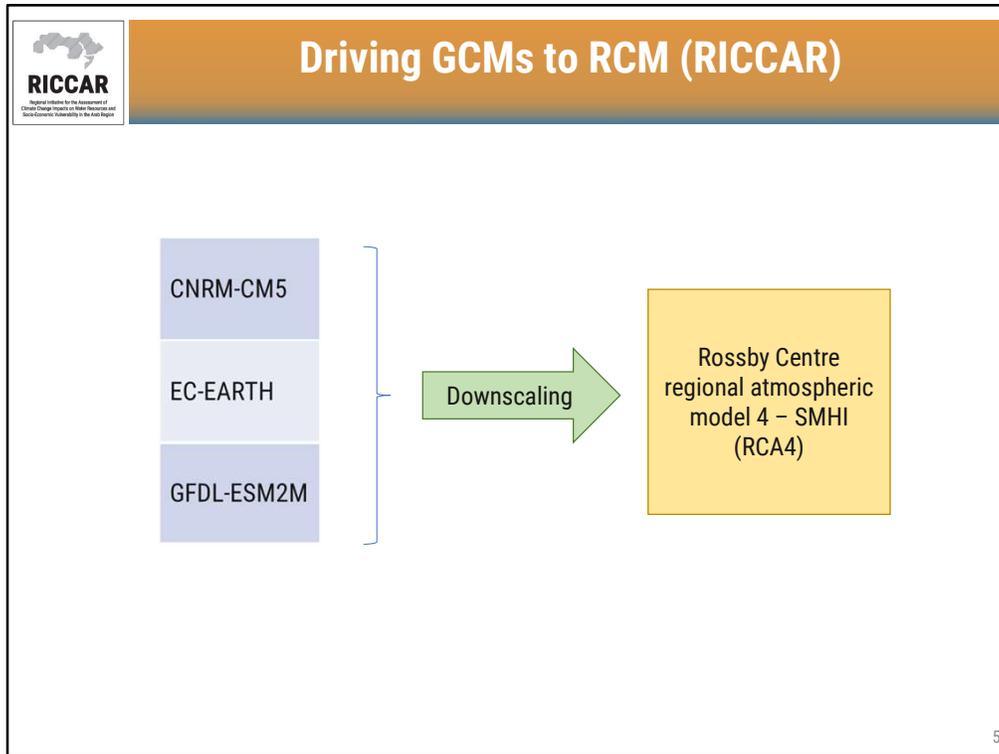

3

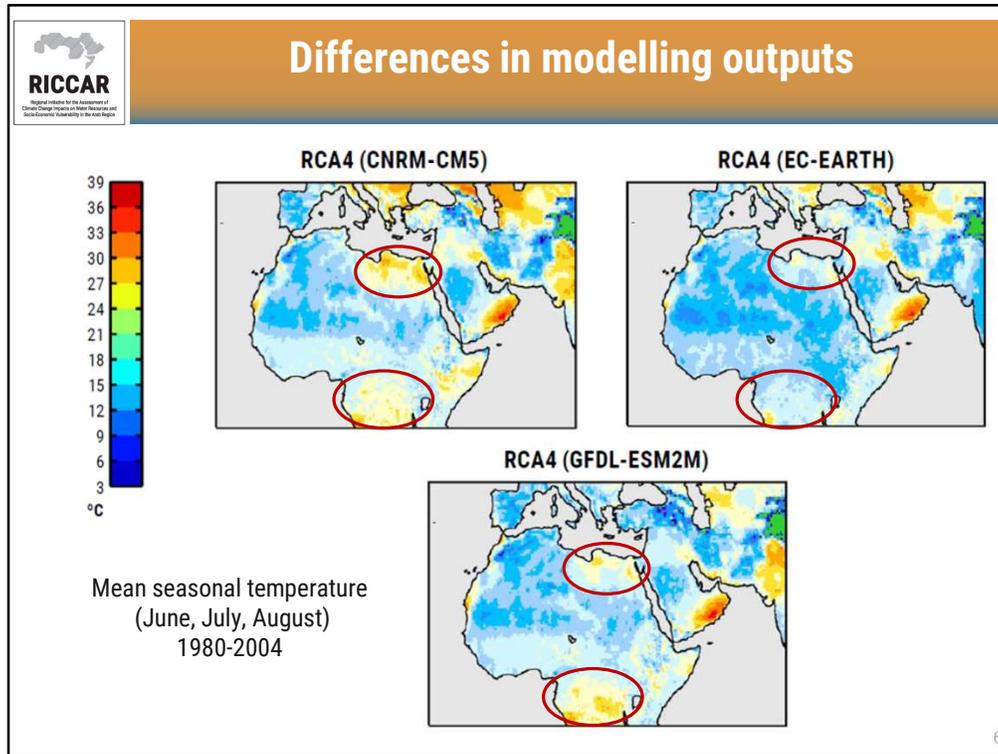

## Driving CMIP5 GCMs used for RICCAR

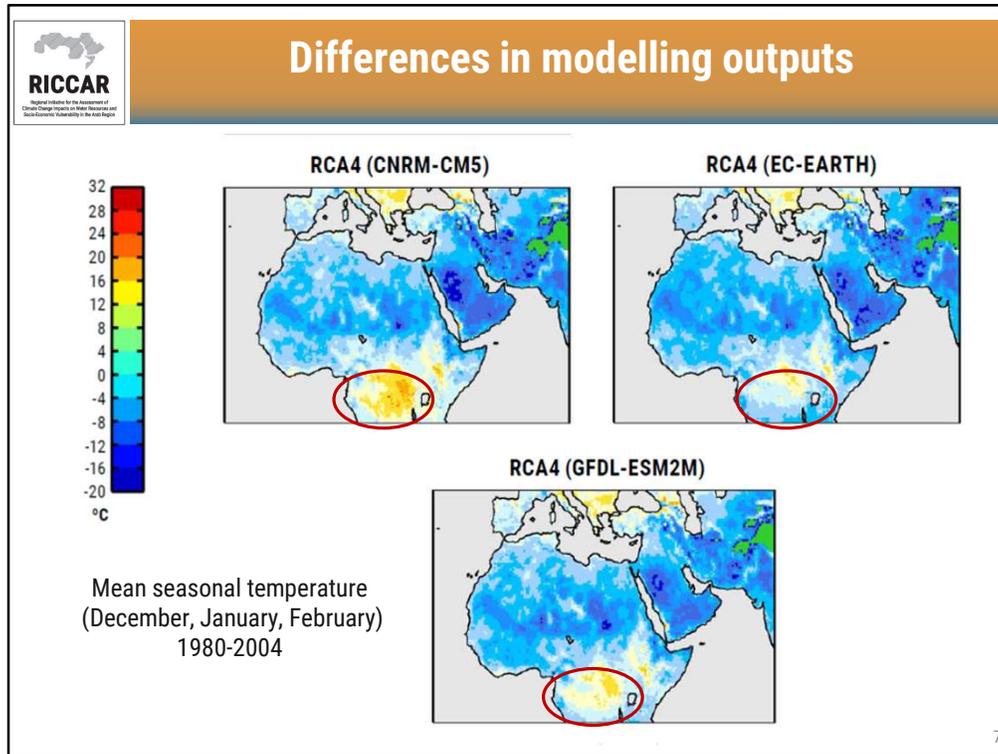

Model Name	Modelling Centre	Country	GCM Resolution (lon x lat)
CNRM-CM5	Européen de Recherche et Formation Avancée en Calcul Scientifique (CERFACS)	France	1.41° × 1.40°
EC-EARTH	EC-EARTH consortium published at Irish Centre for High-End Computing	Netherlands / Ireland	1.13° × 1.13°
GFDL-ESM2M	NOAA Geophysical Fluid Dynamics Laboratory	USA	2.50° × 2.02°

4

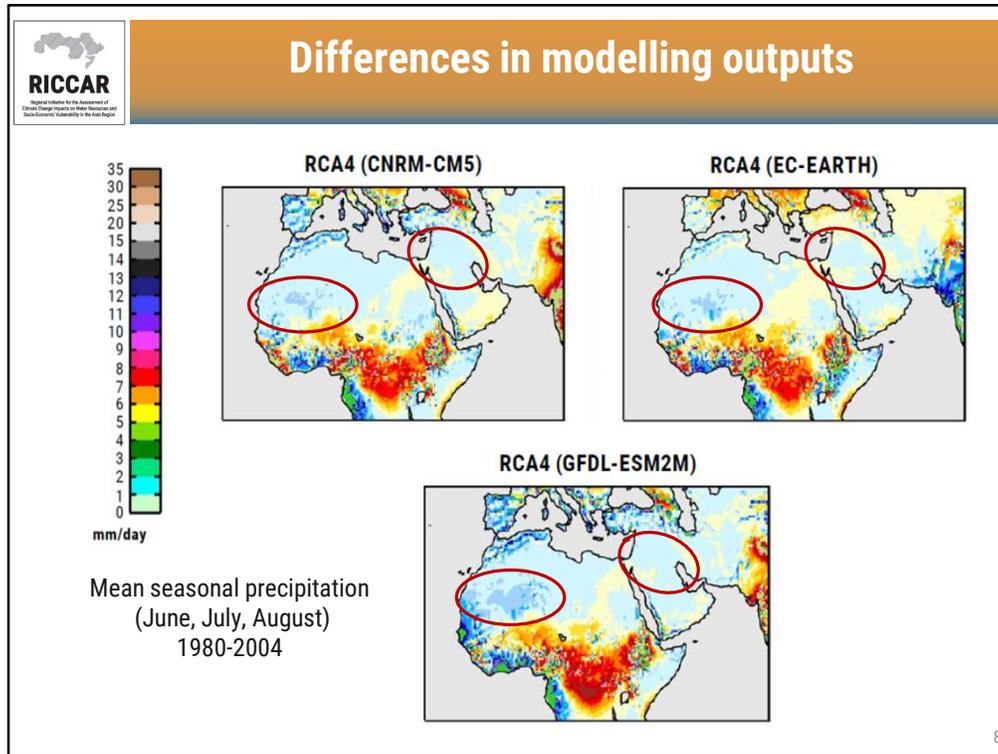

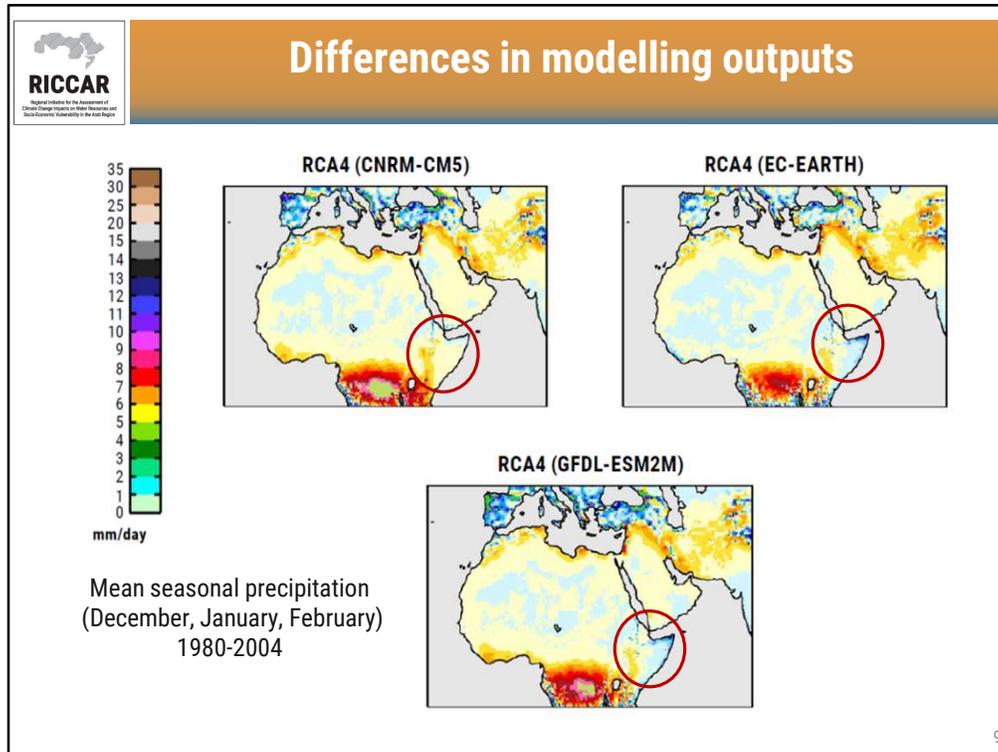

- Maps show differences in modelling outputs based on 3 different driving GCMs (CNRM-CM5, EC-EARTH, and GFDL-ESM2M) downscaled using the same RCM (RCA4).
- Differences are most apparent in eastern North Africa and Sub-Saharan Africa
- More information is found in the RICCAR Technical Note from the Swedish Meteorological and Hydrological Institute (SMHI). Regional Climate Modelling and Regional Hydrological Modelling Applications in the Arab Region.

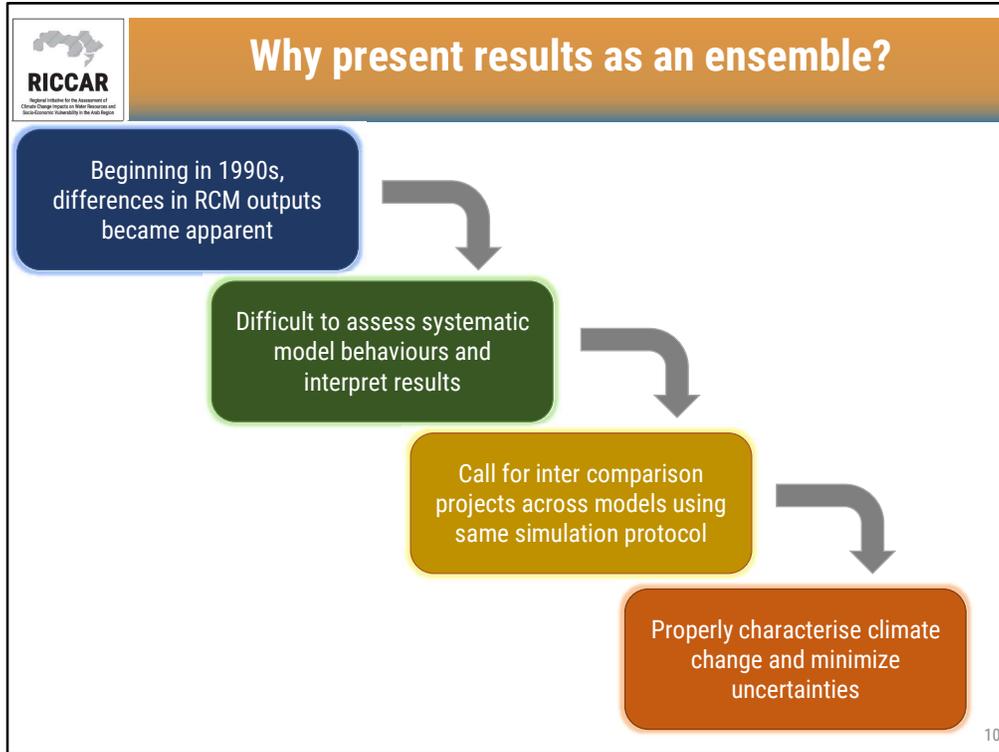

- Maps show differences in modelling outputs based on 3 different driving GCMs (CNRM-CM5, EC-EARTH, and GFDL-ESM2M) downscaled using the same RCM (RCA4).
- Differences are most apparent in Sub-Saharan Africa
- More information is found in the RICCAR Technical Note from the Swedish Meteorological and Hydrological Institute (SMHI). Regional Climate Modelling and Regional Hydrological Modelling Applications in the Arab Region.

- Maps show differences in modelling outputs based on 3 different driving GCMs (CNRM-CM5, EC-EARTH, and GFDL-ESM2M) downscaled using the same RCM (RCA4).
- Differences are most apparent in Mashreq and western Sahel.
- More information is found in the RICCAR Technical Note from the Swedish Meteorological and Hydrological Institute (SMHI). Regional Climate Modelling and Regional Hydrological Modelling Applications in the Arab Region.

- Maps show differences in modelling outputs based on 3 different driving GCMs (CNRM-CM5, EC-EARTH, and GFDL-ESM2M) downscaled using the same RCM (RCA4).
- Differences are most apparent in the Horn of Africa
- More information is found in the RICCAR Technical Note from the Swedish Meteorological and Hydrological Institute (SMHI). Regional Climate Modelling and Regional Hydrological Modelling Applications in the Arab Region.

- Uncertainties in modelling outputs can include scenario uncertainties (RCPs), internal climate variabilities, and differing model assumptions.

## How should ensemble be used?

- Recommended to use the largest possible model ensemble for evaluation and application of climate modelling outputs
- Minimum 3 model members but only 1 RCP scenario (multi-model ensemble)

Driving GCM: CNRM-CM5  
RCM: RCA4

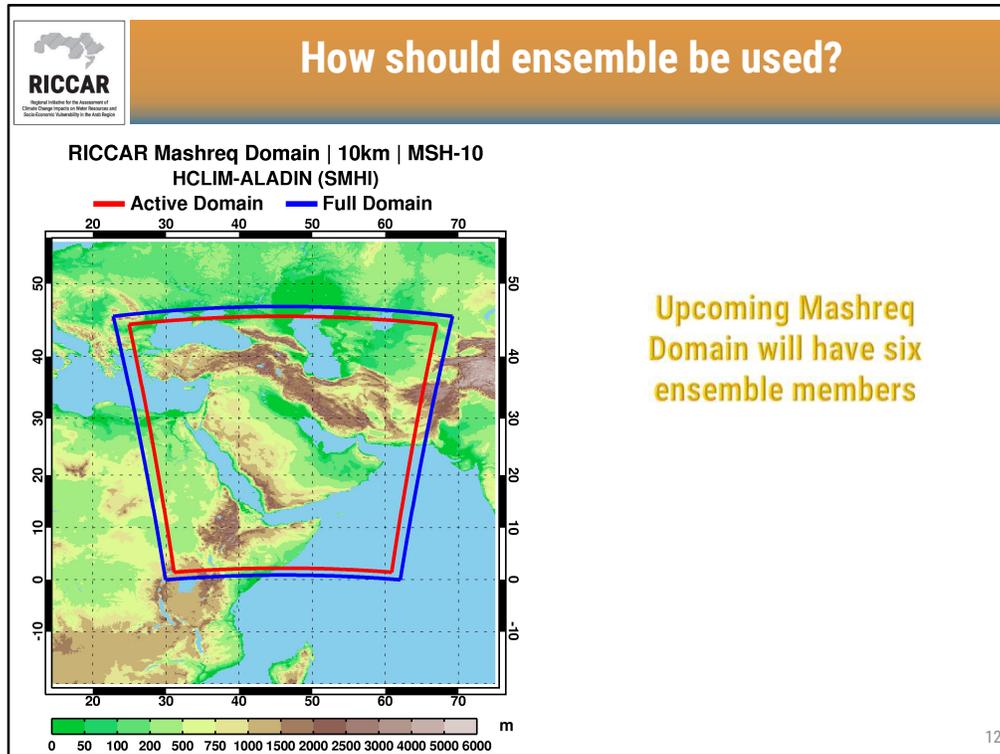

Driving GCM: EC-EARTH  
RCM: RCA4

Driving GCM: GFDL-ESM2M  
RCM: RCA4

- Assess mean of all ensemble members over an extended period (i.e. 20 or 30 years)

11

- RICCAR climate modelling output ensembles are based on 3 members as shown.
- RICCAR ensembles represent a 20-year mean. Results can either be annual or seasonal.

- Mashreq Domain modelling outputs expected starting in early 2021
- Driving GCMs are to be determined. One of them will be EC-EARTH.
- RCM to be used will be ALADIN (Aire Limitée Adaptation dynamique Développement InterNational) developed by CNRM. ALADIN is currently used by institutes from the ALADIN-HIRLAM consortium under the name HCLIM-ALADIN (SMHI).

## How should ensemble be used?

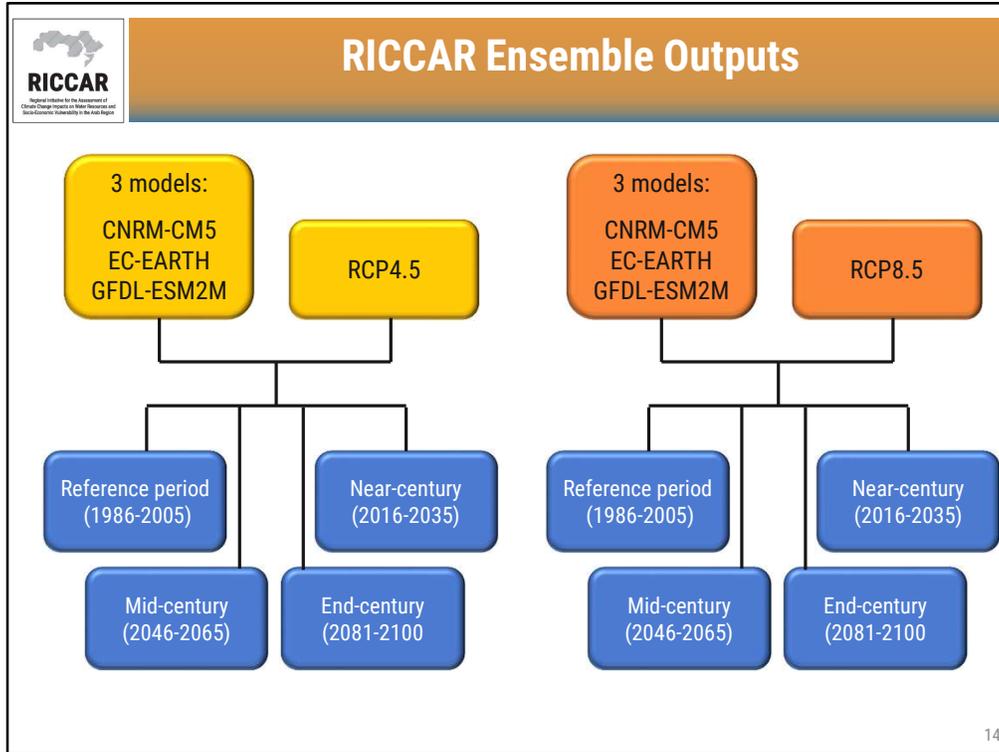

Multi-model ensembles can have multiple GCMs and RCMs

Should be the same:

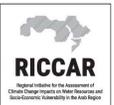

- Scenario/RCP
- Spatial and temporal resolution
- Modelling domain
- Bias-corrected or raw RCM outputs

13

- Multiple GCMs and RCMs can be used. For example for the MNA (Arab) Domain, there are raw RCM output projections available from CORDEX/ESGF that include (shown by GCM/RCM): (a) CNRM-CM5/RCA4, (b) EC-EARTH/RCA4, (c) GFDL-ESM2M/RCA4, (d) MPI-ESM-MR/RegCM4.3, and (e) HadGEM2-ES/RegCM4.3. All 5 modelling outputs can be used to create an ensemble.
- Spatial resolution of all ensemble members should be the same (i.e. all from 50 km / 0.44°)
- Temporal resolution of all ensemble members should be the same (i.e. all daily or all monthly)
- The modelling domain should be the same (i.e. all from Arab Domain) so that boundary conditions are identical
- Do not mix bias-corrected data with raw RCM outputs (not bias-corrected)

- Ensembles for RICCAR are based on the mean output of 3 modelling outputs for 4 different 20-year time periods for 2 different RCP scenarios.
- Available in raster format from the RICCAR Regional Knowledge Hub data portal

## Creating an ensemble

- Ensembles not available on the RICCAR Regional Knowledge Hub must be created manually
- Based on annual or seasonal data
- Minimum 3 model outputs, 20-year period (i.e. “2030”, based on 2021-2040)

15

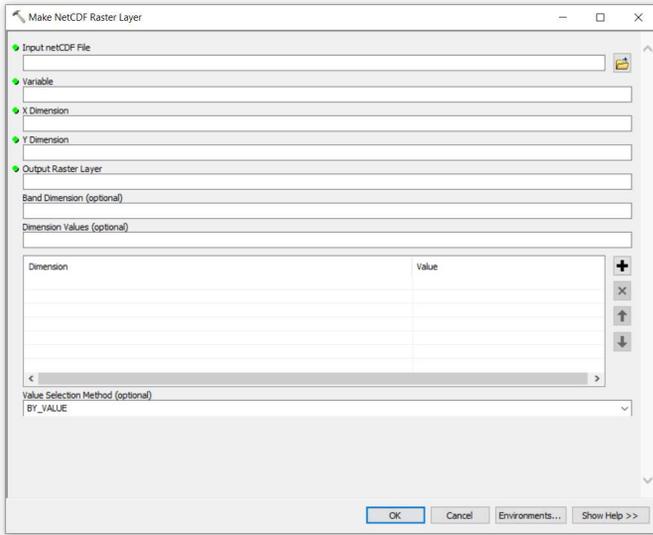

**RICCAR**  
Regional Initiative for the Assessment of  
Climate Change Impacts on Water Resources and  
Socio-Economic Vulnerability in the Arab Region

## Creating an ensemble in GIS

1. Extract each raster time slice
  - a. Make NetCDF Raster Layer

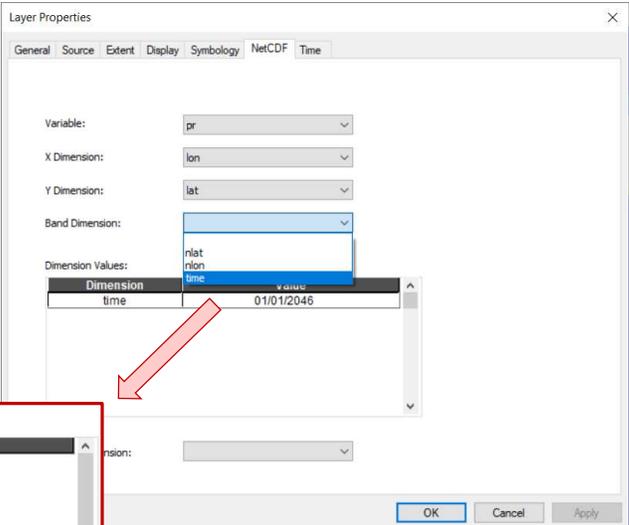

16

- Make NetCDF Raster Layer was discussed during webinar module 2.
- RICCAR Training Manual on the Use of GIS to Analyse Climate Change Data Section 3.2.2.

## Creating an ensemble in GIS

1. Extract each raster time slice
  - a. Make NetCDF Raster Layer
  - b. Open Layer Properties and select time for the Band Dimension

Dimension Values:

Dimension	Value

17

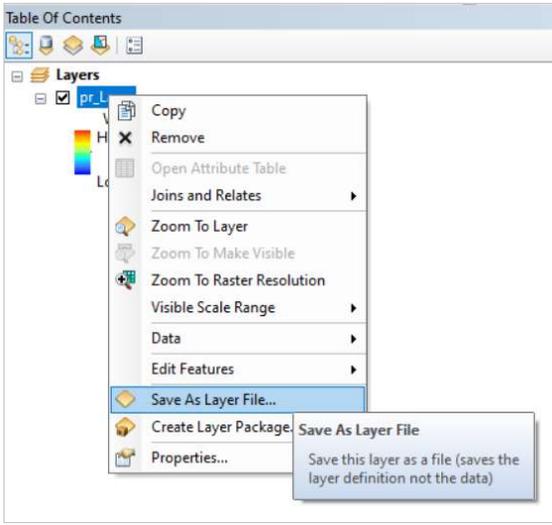

- After selecting time as the Band Dimension, the Dimension Values field will turn blank.

**RICCAR**  
Regional Initiative for the Assessment of  
Climate Change Impacts on Water Resources and  
Socio-Economic Vulnerability in the Arab Region

Creating an ensemble in GIS

1. Extract each raster time slice
  - a. Make NetCDF Raster Layer
  - b. Open Layer Properties and select time for the Band Dimension
  - c. Save as Layer File

18

- Save layer file in user-defined location.

The screenshot displays the 'Table des matières' (Table of Contents) and 'Couches' (Layers) panels in a GIS application. The 'Couches' panel shows a context menu with the option 'Enregistrer comme fichier de couche...' (Save as layer file...) selected. A tooltip provides the following information: 'Enregistre cette couche comme fichier (enregistre la définition de la couche et non les données)' (Save this layer as a file (saves the layer definition and not the data)). The 'Table des matières' panel also shows a context menu with the same option selected. A tooltip provides the following information: 'Enregistrer comme fichier de couche' (Save as layer file) and 'Enregistre cette couche comme fichier (enregistre la définition de la couche et non les données)' (Save this layer as a file (saves the layer definition and not the data)).

### How To: Export each time slice from a NetCDF layer as a single raster (.tif)

**Summary**

The instructions provided describe how to export each time slice from a NetCDF layer as a single raster (.tif).

A NetCDF layer must be created in the ArcMap table of contents before NetCDF raster bands can be exported. The needed toolbox and sample data can be downloaded here: [NetCDF\\_time\\_slice\\_to\\_Raster.zip](#)

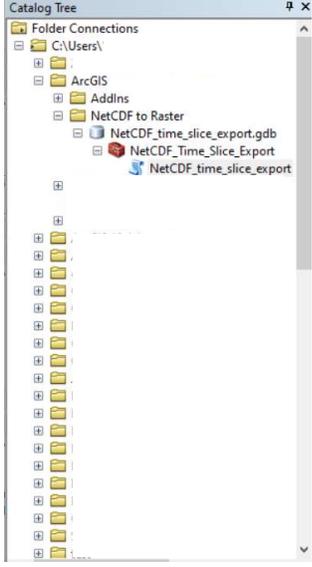

- Using the NetCDF\_time\_slice\_to\_Raster will automatically export each time slice from the NetCDF layer file as a single raster (.tif).
- Save the tool in a user-defined location.

**RICCAR**  
Regional Initiative for the Assessment of  
Climate Change Impacts on Water Resources and  
Socio-Economic Vulnerability in the Arab Region

Creating an ensemble in GIS

1. Extract each raster time slice
  - a. Make NetCDF Raster Layer
  - b. Open Layer Properties and select time for the Band Dimension
  - c. Save as Layer File
  - d. Download and use NetCDF Time Slice to Raster tool
  - e. Open tool from user-defined location in ArcCatalog

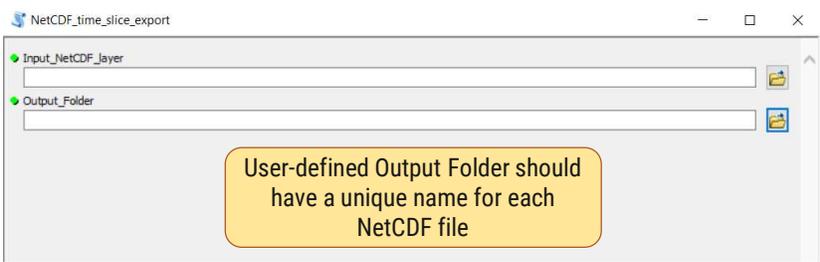

21

- NetCDF Time Slice to Raster tool may be located in a subdirectory under the user-defined location (NetCDF\_time\_slice\_export.gdb > NetCDF\_Time\_Slice\_Export > NetCDF\_time\_slice\_export)

## Creating an ensemble in GIS

1. Extract each raster time slice
  - a. Make NetCDF Raster Layer
  - b. Open Layer Properties and select time for the Band Dimension
  - c. Save as Layer File
  - d. Download and use NetCDF Time Slice to Raster tool
  - e. Open tool from user-defined location in ArcCatalog
  - f. Enter the NetCDF layer and user-defined Output Folder

22

- Select the Input NetCDF layer as saved during step 1.c.
- Once completed, select OK.

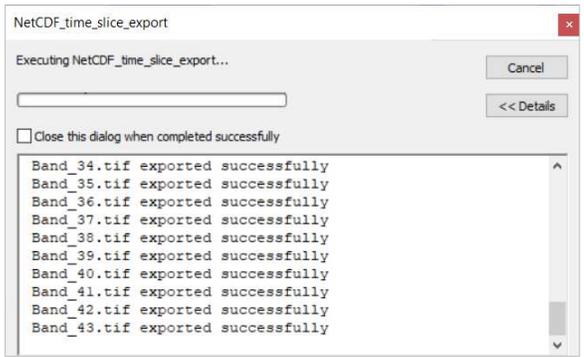

**RICCAR**  
Regional Initiative for the Assessment of  
Climate Change Impacts on Water Resources and  
Socio-Economic Vulnerability in the Arab Region

## Creating an ensemble in GIS

1. Extract each raster time slice
  - a. Make NetCDF Raster Layer
  - b. Open Layer Properties and select time for the Band Dimension
  - c. Save as Layer File
  - d. Download and use NetCDF Time Slice to Raster tool
  - e. Open tool from user-defined location in ArcCatalog
  - f. Enter the NetCDF layer and user-defined Output Folder
  - g. Execute tool

23

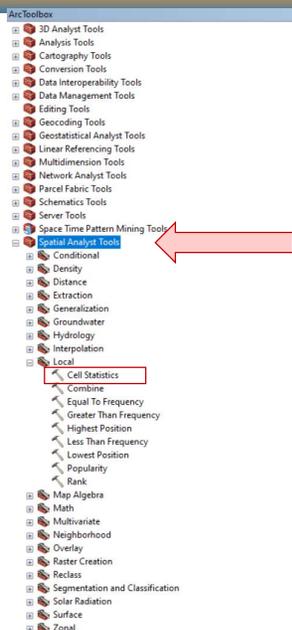

- When executing NetCDF Time Slice to Raster tool, the .tif files will automatically named Band\_(number). The numbers will be in chronological order from 1 to n, where n is the number of time slices. For daily precipitation and temperature, each RICCAR NetCDF will have 365 time slices (or 366 during leap years), representing each day of the year. For the extreme climate indices, there are 150 time slices, one for each year (1951-2100).
- Common error: If the NetCDF Time Slice to Raster output is only one file (Band\_1.tif), it means that the user did not select time as the Band Dimension (step 1.b) before saving as layer file (Step 1.c).
- Note that tool execution may take several minutes depending on computer speed.

1 Nov – 30 Nov	Band_305 to Band_334	1 Nov – 30 Nov	Band_306 to Band_335
1 Dec – 31 Dec	Band_335 to Band_365	1 Dec – 31 Dec	Band_336 to Band_366

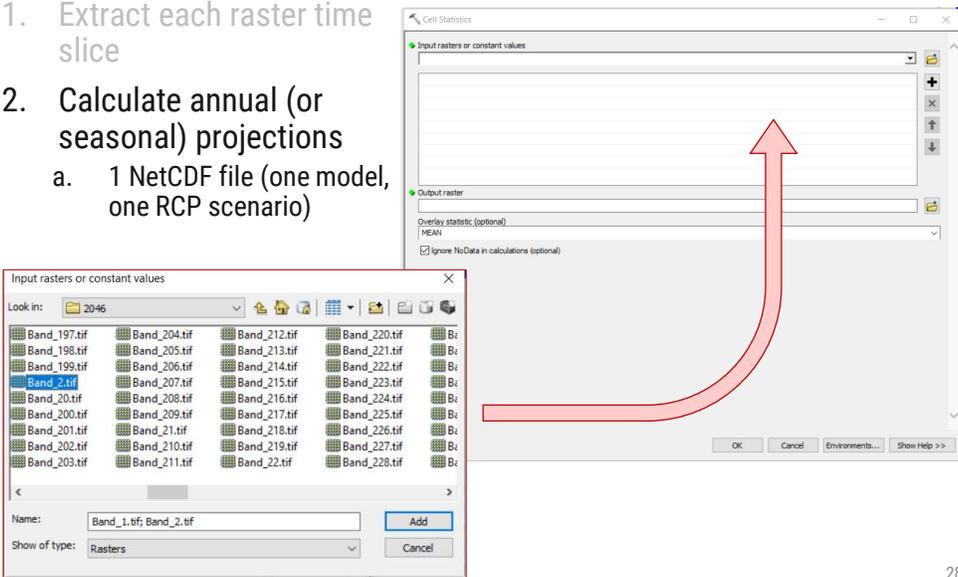

27

- The table on the left is for normal calendar years and the table on the right is for leap years (with 29 February, i.e. 2020, 2024, 2028)

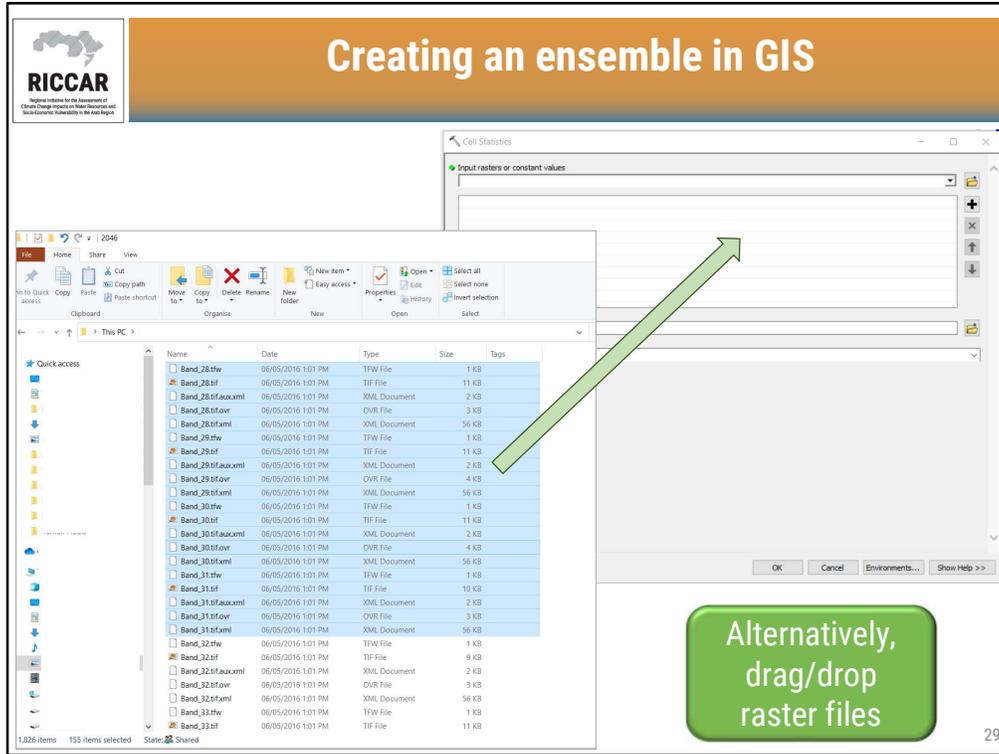

## Creating an ensemble in GIS

1. Extract each raster time slice
2. Calculate annual (or seasonal) projections
  - a. 1 NetCDF file (one model, one RCP scenario)

28

- The raster files not listed in chronological order
- Because of this, it can be tedious to select appropriate raster bands (i.e. for January)

- Be sure to select complete raster file. There will be 5 files for each raster (.tif, .tif.aux.xml, .tif.ovr, .tif.xml, and .tif).
- After this is completed, may get warning message indicating “Invalid drop item/One or more dropped items were invalid and will not be added to the control”. Disregard this message. It is because all 5 files per raster were selected, but all are not necessary to execute the tool.

MEAN

MAJORITY  
MAXIMUM  
MEDIAN  
MINIMUM  
MINORITY  
RANGE  
STD  
SUM  
VARIETY

For temperature data, the units of measurement do not include time (°C)

For precipitation, time is considered → mm/day

31

- Mean is the default overlay statistic
- Selecting mean as the overlay statistic for temperature will calculate the average temperature of all the raster selected.
- If mean is selected as the overlay statistic for precipitation, the result will report the average precipitation in mm/day (because the NetCDF file and rasters are daily data)

**RICCAR**  
Regional Institute for the Assessment of  
Climate Change Impacts on Water Resources and  
Socio-Economic Vulnerability in the Arab Region

## Cell Statistics: Overlay Statistic

For precipitation, more common to report units in mm/month or mm/year

Overlay statistic (optional)

- MEAN
- MAJORITY
- MAXIMUM
- MEDIAN
- MINIMUM
- MINORITY
- RANGE
- STD
- SUM
- VARIETY

32

- Select sum as the overlay statistic to sum monthly data or yearly data

**Cell Statistics: Overlay Statistic**

Overlay statistic (optional)

MEAN

Ignore NoData in calculations (optional)

**Calculate annual average monthly rainfall**

33

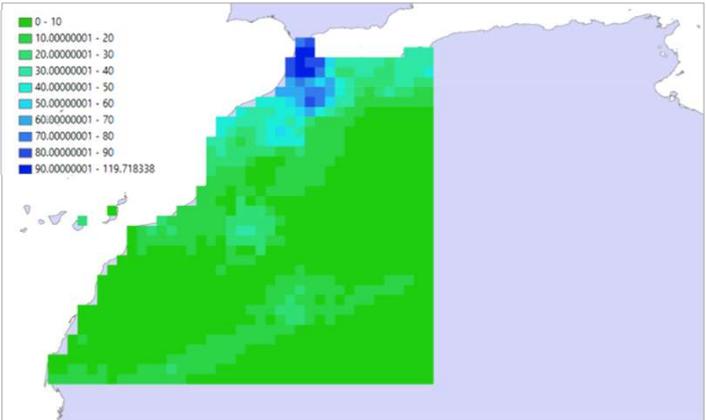

- To find the annual (or seasonal) average of monthly rainfall, select the monthly values as the input rasters and mean as the overlay statistic
- If reporting total yearly rainfall, this was completed in previous step, using the sum as the overlay statistic, selecting all 365 (or 366) raster files.

**RICCAR**  
Regional Initiative for the Assessment of  
Climate Change Impacts on Water Resources and  
Socio-Economic Vulnerability in the Arab Region

## Exercise: Calculate seasonal precipitation (October-March)

1. Data: EC-EARTH, RCP8.5, year 2030 (extracted dataset)
2. Extract NetCDF to raster using tool
3. Sum monthly precipitation
4. Calculate mean monthly precipitation

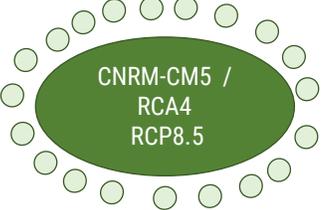

34

- Note that October-March is calculated as January-March 2030 and October-December 2030.
- Result will be as shown when completed. (Adding color scheme and the background map is optional.) Results should range from 0 to 119.72 mm/month.
- Results for each month: Oct: 0 – 197.8; Nov: 0 – 135.28; Dec: 0 – 354.92; Jan: 0 – 47.01; Feb: 0 – 167.81; Mar: 128.43 mm/month

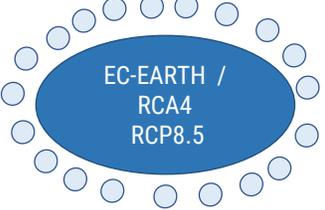

## Creating an ensemble in GIS

1. Extract each raster time slice
2. Calculate annual (or seasonal) projections
  - a. 1 NetCDF file (one model, one RCP scenario)
  - b. Repeat for remaining NetCDF files in ensemble (all models, one RCP scenario)

CNRM-CM5 /  
RCA4  
RCP8.5

EC-EARTH /  
RCA4  
RCP8.5

GFDL-ESM2M /  
RCA4  
RCP8.5

35

- Models shown are the RICCAR GCMs/RCM. Note that ensembles can be composed of any GCM/RCM combination as long as the domain, spatial resolution, RCP scenario, and bias-corrected (or not bias-corrected) are the same.
- Smaller circles represent the mean precipitation (or temperature) for one year per GCM/RCM.

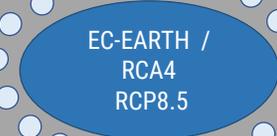

## Creating an ensemble in GIS

1. Extract each raster time slice
2. Calculate annual (or seasonal) projections
  - a. 1 NetCDF file (one model, one RCP scenario)
  - b. Repeat for remaining NetCDF files in ensemble (all models, one RCP scenario)
  - c. Calculate mean for all models in ensemble

RCA4  
RCP8.5

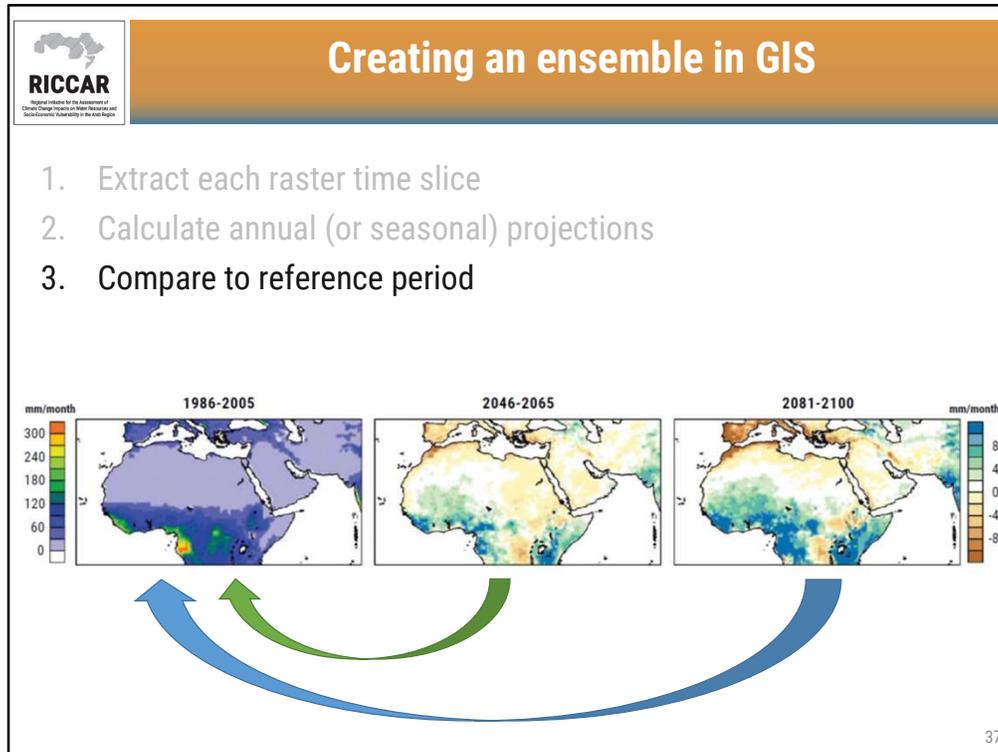

EC-EARTH /  
RCA4  
RCP8.5

GFDL-ESM2M /  
RCA4  
RCP8.5

36

- Ensemble projections are frequently reported as a change in value to quantify climate change, compared to a reference period.
- Reference period used for RICCAR is 1986-2005, defined by IPCC AR5.
- Figure shown is from the RICCAR Arab Climate Change Assessment Report - Main Report, Figure 21, RCP8.5 showing mean change in annual precipitation

**RICCAR**

- To compare projected values to the reference period, use the Raster Calculator, found under Spatial Analyst > Map Algebra.
- Note that the Spatial Analyst extension must be active.

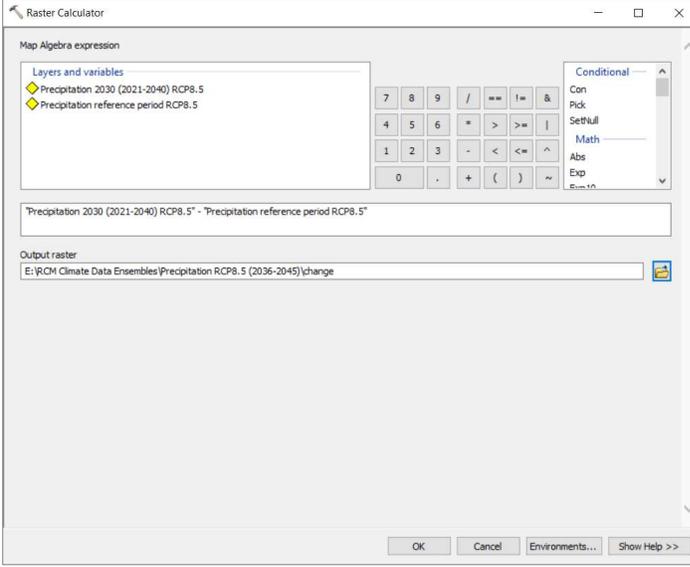

The image shows a side-by-side comparison of the ArcToolbox interface in Arabic and English. On the left, the Arabic menu lists various tool categories such as 'Data Interoperability Tools', 'Geostatistical Analyst Tools', and 'Tracking Analyst Tools'. The 'Algebra spatiale' tool is highlighted in blue, and the 'حاسبة البيانات النقطية' tool is highlighted in red. On the right, the English menu lists the same categories. The 'Spatial Analyst' tool is highlighted in blue, and the 'Calculatrice raster' tool is highlighted in red. Red arrows indicate the correspondence between the Arabic and English tool names.

Climate Change Impacts on Water Resources and  
Socio-Economic Vulnerability in the Arab Region

Creating an ensemble in GIS

1. Extract each raster time slice
2. Calculate annual (or seasonal) projections
3. Compare to reference period

- Note that raster files must be added to ArcMap project to use in the Raster Calculator (shown in Layers and variables).
- Subtract the reference period value from the projected value to calculate the change.
- Recommended to provide a user-defined Output Raster rather than leave the default name to help facilitate future access of the raster file. Note that ArcMap often limits the number of characters in the file name (shown as “change” in the example).

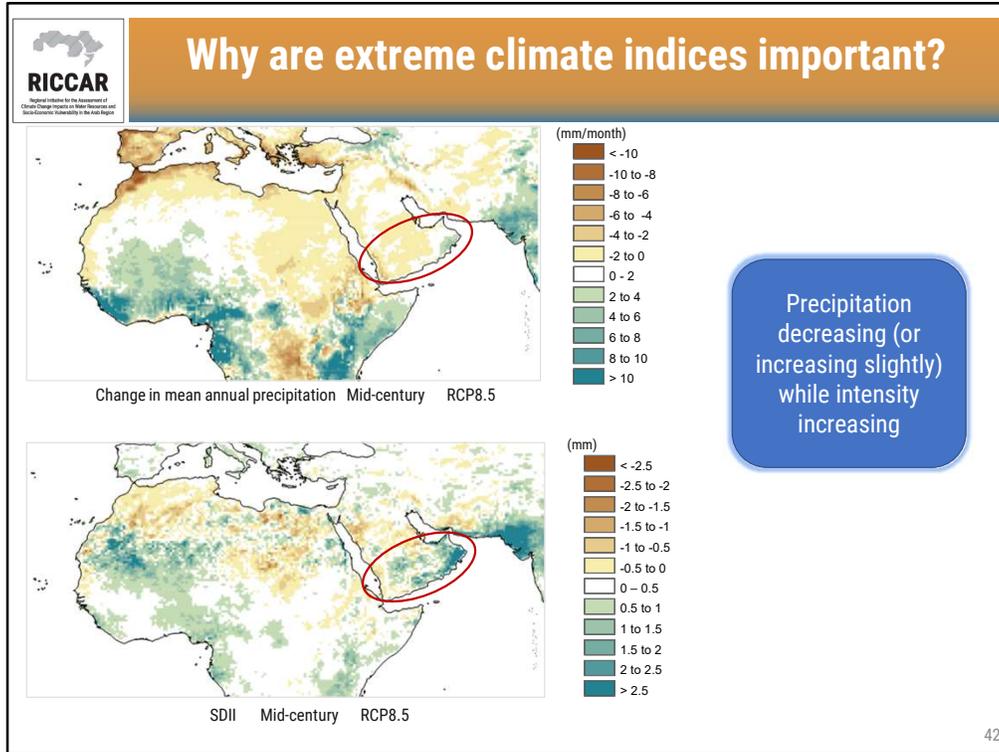

## Extreme climate indices

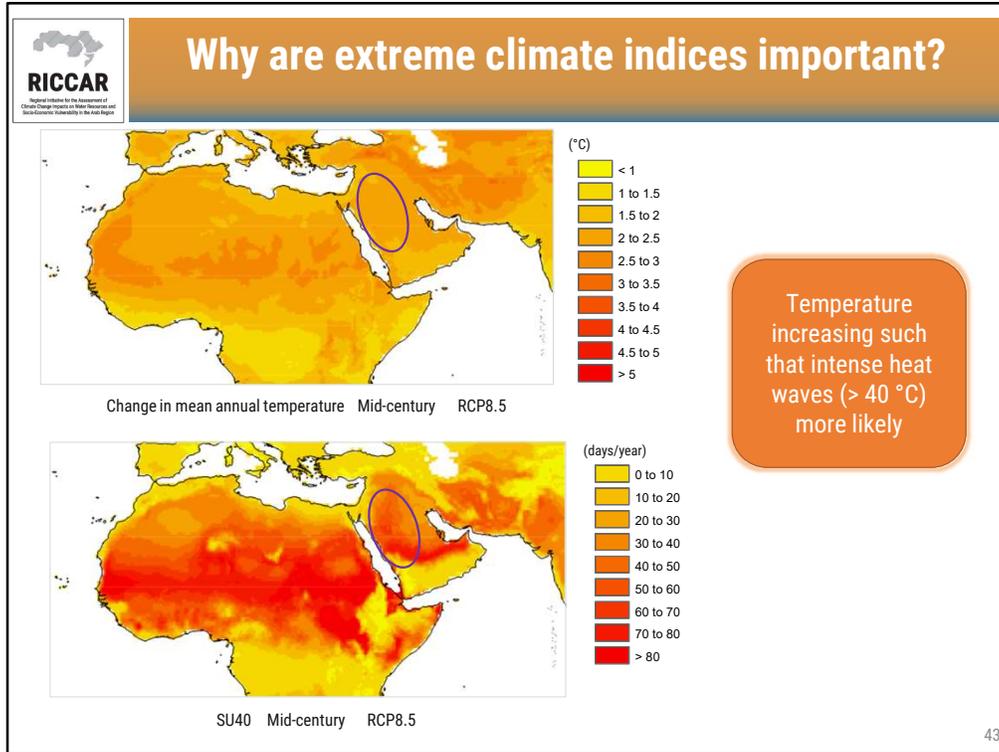

ID	Indicator Name	ID	Indicator Name
FD0	Frost days	WSDI	Warm spell duration indicator
SU25	Summer days	CSDI	Cold spell duration indicator
IDO	Ice days	DTR	Diurnal temperature range
TR20	Tropical nights	RX1day	Max 1-day precipitation amount
GSL	Growing season length	Rx5day	Max 5-day precipitation amount
TXx	Max Tmax	SDII	Simple daily intensity index
TNx	Max Tmin	R10	Number of heavy precipitation days
TXn	Min Tmax	R20	Number of very heavy precipitation days
TNn	Min Tmin	Rnn	Number of days about nn mm
TN10p	Cool nights	CDD	Consecutive dry days
TX10p	Cool days	CWD	Consecutive wet days
TN90p	Warm nights	R95p	Very wet days
TX90p	Warm days	R99p	Extremely wet days
		PRCPTOT	Annual total wet-day precipitation

41

- 27 Core Indices defined by ETCCDI (Expert Team on Climate Change Detection and Indices)
- The 7 indices highlighted were used for RICCAR, plus SU35 and SU40. Note that the indicator name may differ slightly.
- Definitions and units of measurement:
  - FD0 – Annual count when TN (daily minimum) < 0 °C (days)
  - SU25 – Annual count when TX (daily maximum) > 25 °C (days)
  - IDO - Annual count when TX (daily maximum) < 0 °C (days)
  - TR20 – Annual count when TN (daily minimum) > 20 °C (days)
  - GSL – Annual count (1 Jan to 31 Dec in northern hemisphere, 1 Jul to 30 Jun in southern hemisphere) between first span of at least 6 days with daily mean temperature > 5 °C and first span after 1 Jul (1 Jan in southern hemisphere) of 6 days with daily mean temperature < 5 °C (days)
  - TXx – Monthly maximum value of daily maximum temperature (°C )
  - TNx – Monthly maximum value of daily minimum temperature (°C )
  - TXn – Monthly minimum value of daily maximum temperature (°C )
  - TNn – Monthly minimum value of daily minimum temperature (°C )
  - TN10p – Percentage of days when minimum temperature < 10<sup>th</sup> percentile (days)

- TX10p – Percentage of days when maximum temperature < 10<sup>th</sup> percentile (days)
- TN90p – Percentage of days when minimum temperature > 90<sup>th</sup> percentile (days)
- TX90p – Percentage of days when maximum temperature > 90<sup>th</sup> percentile (days)
- WDSI – Annual count of days with at least 6 consecutive days when maximum temperature > 90<sup>th</sup> percentile (days)
- CSDI – Annual count of days with at least 6 consecutive days when minimum temperature > 10<sup>th</sup> percentile (days)
- DTR – Monthly mean difference between daily maximum and daily minimum temperature (°C)
- RX1day – Monthly maximum 1-day precipitation (mm)
- RX5day – Monthly maximum consecutive 5-day precipitation (mm)
- SDII – Annual total precipitation divided by the number of wet days (precipitation ≥ 1.0 mm) (mm/days)
- R10 – Annual count when precipitation ≥ 10 mm (days)
- R20 – Annual count when precipitation ≥ 20 mm (days)
- Rnn – Annual count when precipitation ≥ nn mm (nn is user-defined threshold) (days)
- CDD – Maximum number of consecutive days with precipitation < 1 mm (days)
- CWD – Maximum number of consecutive days with precipitation ≥ 1 mm (days)
- R95p – Annual total precipitation when daily precipitation > 95<sup>th</sup> percentile (mm)
- R99p – Annual total precipitation when daily precipitation > 99<sup>th</sup> percentile (mm)
- PRCPTOT – Annual total precipitation in wet days (precipitation ≥ 1 mm) (mm)
- Can calculate indices from NetCDF files using CDO or from time series data (.txt) for single point location using RClmDex (<http://etccdi.pacificclimate.org/software.shtml>)

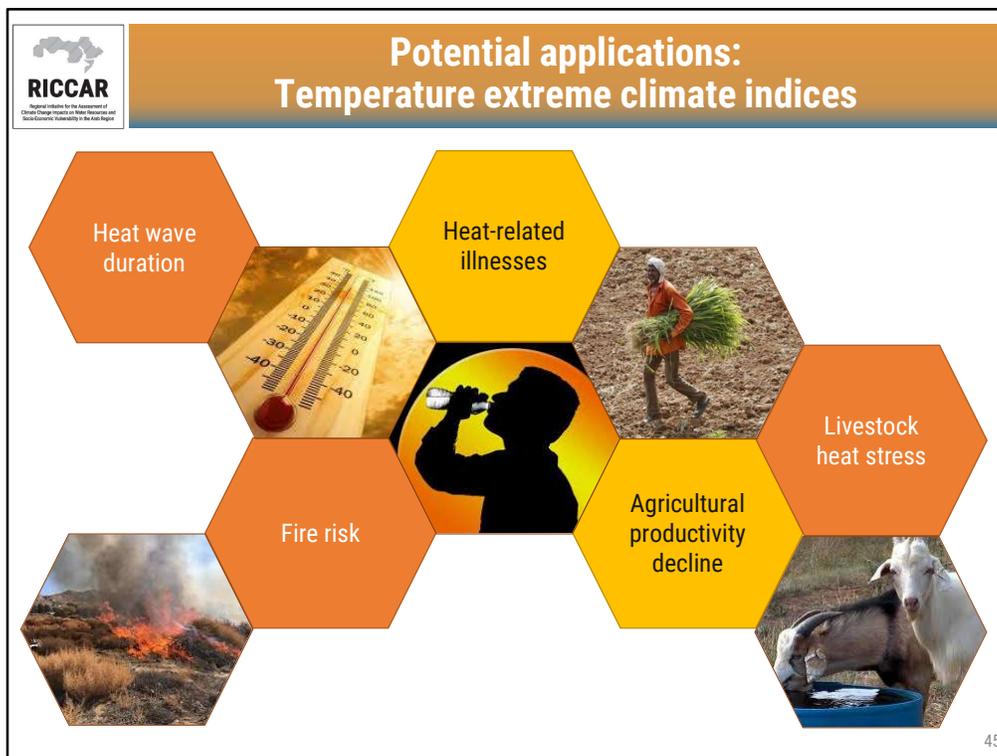

## Why are extreme climate indices important?

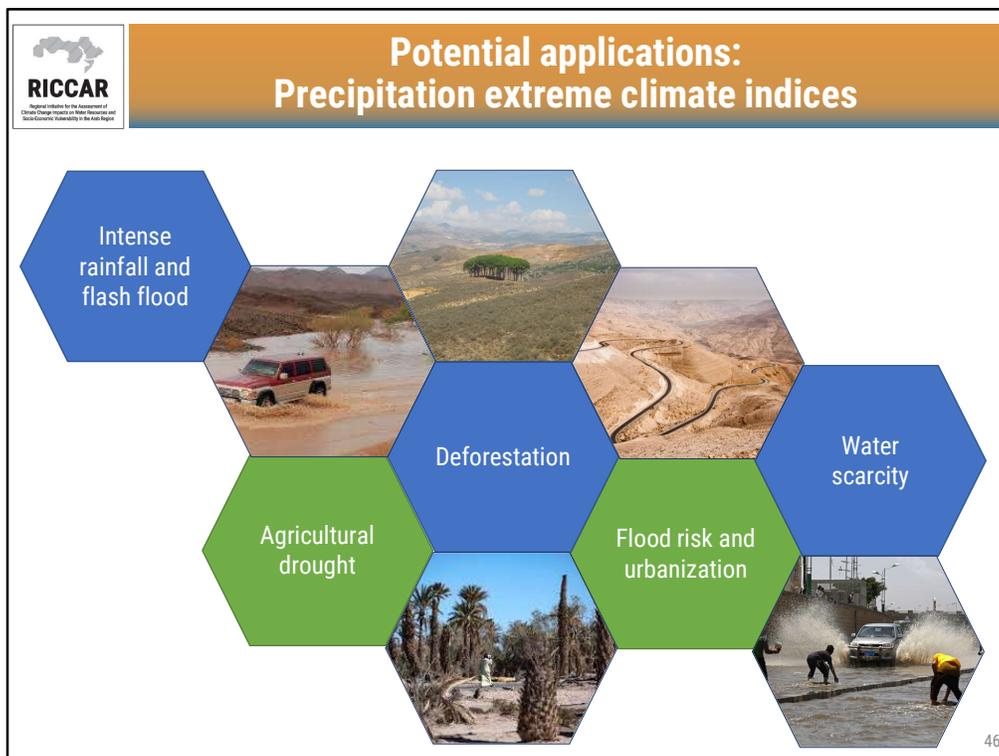

Monthly (or annual) averages can mask out important information on “extremes” which can be useful for sector applications

Use of extreme climate indices can help with mitigation, adaptation, risk reduction, and policy planning
